(d) Any written information we require you to send to or receive from another company is deemed to be a required record under this section. Such records are also deemed to be submissions to EPA. Keep these records for eight years unless the regulations specify a different period. We may require you to send us these records whether or not you are a certificate holder.

(e) Under the Paperwork Reduction Act (44 U.S.C. 3501 et seq), the Office of Management and Budget approves the reporting and recordkeeping specified in the applicable regulations. The following items illustrate the kind of reporting and recordkeeping we

require for vehicles regulated under this part:

(1) We specify the following requirements related to vehicle certification in this part 1037:

(i) In § 1036.150 we include various reporting and recordkeeping requirements related to interim provisions.

(ii) In subpart C of this part we identify a wide range of information required to certify vehicles.

(iii) In subpart G of this part we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various special compliance provisions.

(iv) In § 1037.725, 1037.730, and 1037.735 we specify certain records related to averaging, banking, and trading.

(2) We specify the following requirements related to testing in 40 CFR part 1066:

(i) In 40 CFR 1066.2 we give an overview of principles for reporting information.

(ii) In 40 CFR 1066.25 we establish basic guidelines for storing test information.

(iii) In 40 CFR 1066.695 we identify the specific information and data items to record when measuring emissions.

(3) We specify the following requirements related to the general compliance provisions in 40 CFR part 1068:

(i) In 40 CFR 1068.5 we establish a process for evaluating good engineering judgment related to testing and certification.

(ii) In 40 CFR 1068.25 we describe general provisions related to sending and keeping information.

(iii) In 40 CFR 1068.27 we require manufacturers to make engines and vehicles available for our testing or inspection if we make such a request.

(iv) In 40 CFR 1068.105 we require vehicle manufacturers to keep certain records related to duplicate labels from engine manufacturers.

(v) In 40 CFR 1068.120 we specify recordkeeping related to rebuilding engines.

(vi) In 40 CFR part 1068, subpart C, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various exemptions.

(vii) In 40 CFR part 1068, subpart D, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to importing engines and vehicles.

(viii) In 40 CFR 1068.450 and 1068.455 we specify certain records

related to testing production-line engines and vehicles in a selective enforcement audit.

(ix) In 40 CFR 1068.501 we specify certain records related to investigating and reporting emission-related defects.

(x) In 40 CFR 1068.525 and 1068.530 we specify certain records related to recalling nonconforming engines and vehicles.

(xi) In 40 CFR part 1068, subpart G, we specify certain records for requesting a hearing.

Appendix III to Part 1037—Emission Control Identifiers

This appendix identifies abbreviations for emission control information labels, as required under § 1037.135.

Vehicle Speed Limiters

- VSL—Vehicle speed limiter
- VSLs—“Soft-top” vehicle speed limiter
- VSL—Expiring vehicle speed limiter
- VSLD—Vehicle speed limiter with both “soft-top” and expiration

Idle Reduction Technology

- IRT5—Engine shutoff after 5 minutes or less of idling
- IRTE—Expiring engine shutoff

Tires

- LRR—Low rolling resistance tires (all, including trailers)
- LRRD—Low rolling resistance tires (drive)
- LRRS—Low rolling resistance tires (steer)

Aerodynamic Components

- ATS—Aerodynamic side skirt and/or fuel tank fairing
- ARF—Aerodynamic roof fairing
- ARFR—Adjustable height aerodynamic roof fairing
- TGR—Gap reducing tractor fairing (tractor to trailer gap)
- TGRT—Gap reducing trailer fairing (tractor to trailer gap)
- TATS—Trailer aerodynamic side skirt
- TARF—Trailer aerodynamic rear fairing
- TAUD—Trailer aerodynamic underbody device

Other Components

- ADHV—Vehicle includes advanced hybrid technology components
- ADVO—Vehicle includes other advanced-technology components (*i.e.*, non-hybrid system)
- INV—Vehicle includes innovative (off-cycle) technology components

- ATI—Automatic tire inflation system
- TPMS—Tire pressure monitoring system
- WRTW—Weight-reducing trailer wheels
- WRTC—Weight-reducing trailer upper coupler plate
- WRTS—Weight-reducing trailer axle sub-frames
- WBSW—Wide-base single trailer tires with steel wheel
- WBAW—Wide-base single trailer tires with aluminum wheel
- WBLW—Wide-base single trailer tires with light-weight aluminum alloy wheel
- DWSW—Dual-wide trailer tires with steel wheel
- DWA—Dual-wide trailer tires with aluminum wheel
- DWLW—Dual-wide trailer tires with light-weight aluminum alloy wheel

**Appendix IV to Part 1037—Heavy-Duty
Grade Profile for Phase 2 Steady-State
Test Cycles**

The following table identifies a grade profile for operating vehicles over the highway cruise cycles specified in subpart F of this part. Determine intermediate values by linear interpolation.

		Distance (m)	Grade (%)	Distance (m)	Grade (%)
		6710	3	13340	−1.29
		6762	3.27	13464	−1.66
		6800	3.69	13590	−2.14
		6890	5.01	13666	−2.57
		6980	3.69	13738	−3
		7018	3.27	13790	−3.27

PART 1039—CONTROL OF EMISSIONS FROM NEW AND IN-USE NONROAD COMPRESSION-IGNITION ENGINES

■ 139. The authority citation for part 1039 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Overview and Applicability

■ 140. Section 1039.2 is revised to read as follows:

§ 1039.2 Who is responsible for compliance?

The regulations in this part 1039 contain provisions that affect both manufacturers and others. However, the requirements of this part are generally addressed to the manufacturer. The term “you” generally means the manufacturer, as defined in § 1039.801, especially for issues related to certification. Note that for engines that become new after being placed into service (such as engines converted from highway or stationary use), the requirements that normally apply for manufacturers of freshly manufactured engines apply to the importer or any other entity we allow to obtain a certificate of conformity.

■ 141. Section 1039.5 is amended by revising the introductory text, adding paragraph (a)(2)(iii), and revising paragraph (e) to read as follows:

§ 1039.5 Which engines are excluded from this part’s requirements?

This part does not apply to certain nonroad engines, as follows:

(a) * * *

(2) * * *

(iii) Locomotive engines produced under the provisions of 40 CFR 1033.625.

* * * * *

(e) *Engines used in recreational vehicles.* Engines certified to meet the requirements of 40 CFR part 1051 are not subject to the provisions of this part 1039.

■ 142. Section 1039.30 is revised to read as follows:

§ 1039.30 Submission of information.

Unless we specify otherwise, send all reports and requests for approval to the Designated Compliance Officer (see § 1039.801). See § 1039.825 for additional reporting and recordkeeping provisions.

Subpart B—Emission Standards and Related Requirements

■ 143. Section 1039.101 is amended by revising paragraph (f) to read as follows:

§ 1039.101 What exhaust emission standards must my engines meet after the 2014 model year?

* * * * *

(f) *Fuel types.* The exhaust emission standards in this section apply for engines using the fuel type on which the engines in the engine family are designed to operate, except for engines certified under § 1039.615. For engines certified under § 1039.615, the standards of this section apply to emissions measured using the specified

test fuel. You must meet the numerical emission standards for NMHC in this section based on the following types of hydrocarbon emissions for engines powered by the following fuels:

(1) Alcohol-fueled engines: THCE emissions.

(2) Gaseous-fueled engines: Nonmethane-nonethane hydrocarbon emissions.

(3) Other engines: NMHC emissions.

* * * * *

■ 144. Section 1039.102 is amended by revising paragraph (e)(3) to read as follows:

§ 1039.102 What exhaust emission standards and phase-in allowances apply for my engines in model year 2014 and earlier?

* * * * *

(e) * * *

(3) You may use NO_x + NMHC emission credits to certify an engine family to the alternate NO_x + NMHC standards in this paragraph (e)(3) instead of the otherwise applicable alternate NO_x and NMHC standards. Calculate the alternate NO_x + NMHC standard by adding 0.1 g/kW-hr to the numerical value of the applicable alternate NO_x standard of paragraph (e)(1) or (2) of this section. Engines certified to the NO_x + NMHC standards of this paragraph (e)(3) may not generate emission credits. The FEL caps for engine families certified under this paragraph (e)(3) are the previously applicable NO_x + NMHC standards of 40 CFR 89.112 (generally the Tier 3 standards).

* * * * *

■ 145. Section 1039.104 is amended by revising paragraph (g)(5) and adding paragraph (i) to read as follows:

§ 1039.104 Are there interim provisions that apply only for a limited time?

* * * * *

(g) * * *

(5) You may certify engines under this paragraph (g) in any model year provided for in Table 1 of this section without regard to whether or not the engine family’s FEL is at or below the otherwise applicable FEL cap. For example, a 200 kW engine certified to the NO_x + NMHC standard of § 1039.102(e)(3) with an FEL equal to the FEL cap of 4.0 g/kW-hr may nevertheless be certified under this paragraph (g).

* * * * *

(i) *Lead time for diagnostic controls.* Model year 2017 and earlier engines are not subject to the requirements for diagnostic controls as specified in § 1039.110.

■ 146. Section 1039.107 is amended by revising paragraph (b)(2) to read as follows:

§ 1039.107 What evaporative emission standards and requirements apply?

* * * * *

(b) * * *

(2) Present test data to show that equipment using your engines meets the evaporative emission standards we specify in this section if you do not use design-based certification under 40 CFR 1048.245.

■ 147. Section 1039.110 is added to subpart B to read as follows:

§ 1039.110 Recording reductant use and other diagnostic functions.

(a) Engines equipped with SCR systems using a reductant other than the engine's fuel must have a diagnostic system that monitors reductant quality and tank levels and alert operators to the need to refill the reductant tank before it is empty, or to replace the reductant if it does not meet your concentration specifications. Unless we approve other alerts, use a warning lamp or an audible alarm. You do not need to separately monitor reductant quality if your system uses input from an exhaust NO_x sensor (or other sensor) to alert operators when reductant quality is inadequate. However, tank level must be monitored in all cases.

(b) You may equip your engine with other diagnostic features. If you do, they must be designed to allow us to read and interpret the codes. Note that § 1039.205 requires you to provide us any information needed to read, record, and interpret all the information broadcast by an engine's onboard computers and electronic control units.

■ 148. Section 1039.120 is amended by revising paragraph (b) introductory text to read as follows:

§ 1039.120 What emission-related warranty requirements apply to me?

* * * * *

(b) *Warranty period.* Your emission-related warranty must be valid for at least as long as the minimum warranty periods listed in this paragraph (b) in hours of operation and years, whichever comes first. You may offer an emission-related warranty more generous than we require. The emission-related warranty for the engine may not be shorter than any basic mechanical warranty you provide without charge for the engine. Similarly, the emission-related warranty for any component may not be shorter than any warranty you provide without charge for that component. This means that your warranty may not treat emission-related and nonemission-

related defects differently for any component. If an engine has no hour meter, we base the warranty periods in this paragraph (b) only on the engine's age (in years). The warranty period begins when the engine is placed into service. The minimum warranty periods are shown in the following table:

* * * * *

■ 149. Section 1039.125 is amended by revising paragraphs (a)(2)(i), (a)(3)(i), (a)(4), (c), (e), and (f) introductory text to read as follows:

§ 1039.125 What maintenance instructions must I give to buyers?

* * * * *

(a) * * *

(2) * * *

(i) For EGR-related filters and coolers, DEF filters, crankcase ventilation valves and filters, and fuel injector tips (cleaning only), the minimum interval is 1,500 hours.

* * * * *

(3) * * *

(i) For EGR-related filters and coolers, DEF filters, crankcase ventilation valves and filters, and fuel injector tips (cleaning only), the minimum interval is 1,500 hours.

* * * * *

(4) For particulate traps, trap oxidizers, and components related to either of these, scheduled maintenance may include cleaning or repair at the intervals specified in paragraph (a)(2)(ii) or (a)(3)(ii) of this section, as applicable. Scheduled maintenance may include a shorter interval for cleaning or repair and may also include adjustment or replacement, but only if we approve it. We will approve your request if you provide the maintenance free of charge and clearly state this in your maintenance instructions, and you provide us additional information as needed to convince us that the maintenance will occur.

* * * * *

(c) *Special maintenance.* You may specify more frequent maintenance to address problems related to special situations, such as atypical engine operation. You must clearly state that this additional maintenance is associated with the special situation you are addressing. You may also address maintenance of low-use engines (such as recreational or stand-by engines) by specifying the maintenance interval in terms of calendar months or years in addition to your specifications in terms of engine operating hours. All special maintenance instructions must be consistent with good engineering judgment. We may disapprove your maintenance instructions if we

determine that you have specified special maintenance steps to address maintenance that is unlikely to occur in use, or engine operation that is not atypical. For example, this paragraph (c) does not allow you to design engines that require special maintenance for a certain type of expected operation. If we determine that certain maintenance items do not qualify as special maintenance under this paragraph (c), you may identify this as recommended additional maintenance under paragraph (b) of this section.

* * * * *

(e) *Maintenance that is not emission-related.* For maintenance unrelated to emission controls, you may schedule any amount of inspection or maintenance. You may also take these inspection or maintenance steps during service accumulation on your emission-data engines, as long as they are reasonable and technologically necessary. This might include adding engine oil, changing air, fuel, or oil filters, servicing engine-cooling systems or fuel-water separator cartridges or elements, and adjusting idle speed, governor, engine bolt torque, valve lash, or injector lash. You may not perform this nonemission-related maintenance on emission-data engines more often than the least frequent intervals that you recommend to the ultimate purchaser.

(f) *Source of parts and repairs.* State clearly in your written maintenance instructions that a repair shop or person of the owner's choosing may maintain, replace, or repair emission-control devices and systems. Your instructions may not require components or service identified by brand, trade, or corporate name. Also, do not directly or indirectly condition your warranty on a requirement that the engine be serviced by your franchised dealers or any other service establishments with which you have a commercial relationship. You may disregard the requirements in this paragraph (f) if you do one of two things:

* * * * *

■ 150. Section 1039.130 is amended by adding paragraph (b)(4) and revising paragraph (b)(5) to read as follows:

§ 1039.130 What installation instructions must I give to equipment manufacturers?

* * * * *

(b) * * *

(4) Describe any necessary steps for installing the diagnostic system described in § 1039.110.

(5) Describe how your certification is limited for any type of application. For example, if your engines are certified only for constant-speed operation, tell

equipment manufacturers not to install the engines in variable-speed applications.

* * * *

■ 151. Section 1039.135 is amended by revising paragraphs (b), (c)(2), and (d) to read as follows:

§ 1039.135 How must I label and identify the engines I produce?

* * * *

(b) At the time of manufacture, affix a permanent and legible label identifying each engine. The label must meet the requirements of 40 CFR 1068.45.

(c) * * *

(2) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

* * * *

(d) You may add information to the emission control information label as follows:

(1) You may identify other emission standards that the engine meets or does not meet (such as international standards), as long as this does not cause you to omit any of the information described in paragraphs (c)(5) through (10) of this section. You may add the information about the other emission standards to the statement we specify, or you may include it in a separate statement.

(2) You may add other information to ensure that the engine will be properly maintained and used.

(3) You may add appropriate features to prevent counterfeit labels. For example, you may include the engine's unique identification number on the label.

* * * *

Subpart C—Certifying Engine Families

■ 152. Section 1039.201 is amended by revising paragraphs (a) and (g) to read as follows:

§ 1039.201 What are the general requirements for obtaining a certificate of conformity?

(a) You must send us a separate application for a certificate of conformity for each engine family. A certificate of conformity is valid for new production from the indicated effective date until the end of the model year for which it is issued, which may not extend beyond December 31 of that year. No new certificate will be issued after December 31 of the model year. You may amend your application for certification after the end of the model year in certain circumstances as

described in §§ 1039.220 and 1039.225. You must renew your certification annually for any engines you continue to produce.

* * * *

(g) We may require you to deliver your test engines to a facility we designate for our testing (see § 1039.235(c)). Alternatively, you may choose to deliver another engine that is identical in all material respects to the test engine, or another engine that we determine can appropriately serve as an emission-data engine for the engine family.

* * * *

■ 153. Section 1039.205 is amended by revising paragraph (r)(1) and adding paragraph (bb) to read as follows:

§ 1039.205 What must I include in my application?

* * * *

(r) * * *

(1) Report all valid test results involving measurement of pollutants for which emission standards apply. Also indicate whether there are test results from invalid tests or from any other tests of the emission-data engine, whether or not they were conducted according to the test procedures of subpart F of this part. We may require you to report these additional test results. We may ask you to send other information to confirm that your tests were valid under the requirements of this part and 40 CFR part 1065.

* * * *

(bb) For imported engines or equipment, identify the following:

(1) Describe your normal practice for importing engines. For example, this may include identifying the names and addresses of any agents you have authorized to import your engines.

(2) For engines below 560 kW, identify a test facility in the United States where you can test your engines if we select them for testing under a selective enforcement audit, as specified in 40 CFR part 1068, subpart E.

■ 154. Section 1039.220 is amended by revising the section heading as to read as follows:

§ 1039.220 How do I amend my maintenance instructions?

* * * *

■ 155. Section 1039.225 is amended by adding paragraphs (b)(4) and (g) to read as follows:

§ 1039.225 How do I amend my application for certification?

* * * *

(b) * * *

(4) Include any other information needed to make your application correct and complete.

* * * *

(g) You may produce engines as described in your amended application for certification and consider those engines to be in a certified configuration if we approve a new or modified engine configuration during the model year under paragraph (d) of this section. Similarly, you may modify in-use engines as described in your amended application for certification and consider those engines to be in a certified configuration if we approve a new or modified engine configuration at any time under paragraph (d) of this section. Modifying a new or in-use engine to be in a certified configuration does not violate the tampering prohibition of 40 CFR 1068.101(b)(1), as long as this does not involve changing to a certified configuration with a higher family emission limit.

■ 156. Section 1039.230 is amended by revising paragraph (b)(1) to read as follows:

§ 1039.230 How do I select engine families?

* * * *

(b) * * *

(1) The combustion cycle and fuel. However, you do not need to separate dual-fuel and flexible-fuel engines into separate engine families.

* * * *

■ 157. Section 1039.235 is amended by revising paragraphs (a), (b), (c) introductory text, (c)(4), and (d)(1) to read as follows:

§ 1039.235 What testing requirements apply for certification?

* * * *

(a) Select an emission-data engine from each engine family for testing. Select the engine configuration with the highest volume of fuel injected per cylinder per combustion cycle at the point of maximum torque—unless good engineering judgment indicates that a different engine configuration is more likely to exceed (or have emissions nearer to) an applicable emission standard or FEL. If two or more engines have the same fueling rate at maximum torque, select the one with the highest fueling rate at rated speed. In making this selection, consider all factors expected to affect emission-control performance and compliance with the standards, including emission levels of all exhaust constituents, especially NO_x and PM.

(b) Test your emission-data engines using the procedures and equipment

specified in subpart F of this part. In the case of dual-fuel engines, measure emissions when operating with each type of fuel for which you intend to certify the engine. In the case of flexible-fuel engines, measure emissions when operating with the fuel mixture that best represents in-use operation or is most likely to have the highest NO_x emissions (or NO_x+NMHC emissions for engines subject to NO_x+NMHC standards), though you may ask us instead to perform tests with both fuels separately if you can show that intermediate mixtures are not likely to occur in use.

(c) We may perform confirmatory testing by measuring emissions from any of your emission-data engines or other engines from the engine family, as follows:

* * * * *

(4) Before we test one of your engines, we may calibrate it within normal production tolerances for anything we do not consider an adjustable parameter. For example, this would apply for an engine parameter that is subject to production variability because it is adjustable during production, but is not considered an adjustable parameter (as defined in § 1039.801) because it is permanently sealed. For parameters that relate to a level of performance that is itself subject to a specified range (such as maximum power output), we will generally perform any calibration under this paragraph (c)(4) in a way that keeps performance within the specified range.

(d) * * *

(1) The engine family from the previous model year differs from the current engine family only with respect to model year, items identified in § 1039.225(a), or other characteristics unrelated to emissions. We may waive this criterion for differences we determine not to be relevant.

* * * * *

■ 158. Section 1039.240 is amended by revising paragraphs (c) and (d) and removing paragraph (e).

The revisions read as follows:

§ 1039.240 How do I demonstrate that my engine family complies with exhaust emission standards?

* * * * *

(c) To compare emission levels from the emission-data engine with the applicable emission standards, apply deterioration factors to the measured emission levels for each pollutant. Section 1039.245 specifies how to test your engine to develop deterioration factors that represent the deterioration expected in emissions over your engines' full useful life. Your

deterioration factors must take into account any available data from in-use testing with similar engines. Small-volume engine manufacturers may use assigned deterioration factors that we establish. Apply deterioration factors as follows:

(1) *Additive deterioration factor for exhaust emissions.* Except as specified in paragraph (c)(2) of this section, use an additive deterioration factor for exhaust emissions. An additive deterioration factor is the difference between exhaust emissions at the end of the useful life and exhaust emissions at the low-hour test point. In these cases, adjust the official emission results for each tested engine at the selected test point by adding the factor to the measured emissions. If the factor is less than zero, use zero. Additive deterioration factors must be specified to one more decimal place than the applicable standard.

(2) *Multiplicative deterioration factor for exhaust emissions.* Use a multiplicative deterioration factor if good engineering judgment calls for the deterioration factor for a pollutant to be the ratio of exhaust emissions at the end of the useful life to exhaust emissions at the low-hour test point. For example, if you use aftertreatment technology that controls emissions of a pollutant proportionally to engine-out emissions, it is often appropriate to use a multiplicative deterioration factor. Adjust the official emission results for each tested engine at the selected test point by multiplying the measured emissions by the deterioration factor. If the factor is less than one, use one. A multiplicative deterioration factor may not be appropriate in cases where testing variability is significantly greater than engine-to-engine variability. Multiplicative deterioration factors must be specified to one more significant figure than the applicable standard.

(3) *Sawtooth and other nonlinear deterioration patterns.* The deterioration factors described in paragraphs (c)(1) and (2) of this section assume that the highest useful life emissions occur either at the end of useful life or at the low-hour test point. The provisions of this paragraph (c)(3) apply where good engineering judgment indicates that the highest emissions over the useful life will occur between these two points. For example, emissions may increase with service accumulation until a certain maintenance step is performed, then return to the low-hour emission levels and begin increasing again. Base deterioration factors for engines with such emission patterns on the difference between (or ratio of) the point at which the highest emissions occur and the

low-hour test point. Note that this applies for maintenance-related deterioration only where we allow such critical emission-related maintenance.

(4) *Deterioration factor for smoke.* Deterioration factors for smoke are always additive, as described in paragraph (c)(1) of this section.

(5) *Deterioration factor for crankcase emissions.* If your engine vents crankcase emissions to the exhaust or to the atmosphere, you must account for crankcase emission deterioration, using good engineering judgment. You may use separate deterioration factors for crankcase emissions of each pollutant (either multiplicative or additive) or include the effects in combined deterioration factors that include exhaust and crankcase emissions together for each pollutant.

(6) *Dual-fuel and flexible-fuel engines.* In the case of dual-fuel and flexible-fuel engines, apply deterioration factors separately for each fuel type. You may accumulate service hours on a single emission-data engine using the type of fuel or the fuel mixture expected to have the highest combustion and exhaust temperatures; you may ask us to approve a different fuel mixture if you demonstrate that a different criterion is more appropriate.

(d) Determine the official emission result for each pollutant to at least one more decimal place than the applicable standard. Apply the deterioration factor to the official emission result, as described in paragraph (c) of this section, then round the adjusted figure to the same number of decimal places as the emission standard. Compare the rounded emission levels to the emission standard for each emission-data engine. In the case of NO_x+NMHC standards, apply the deterioration factor to each pollutant and then add the results before rounding.

■ 159. Section 1039.250 is amended by revising paragraphs (b)(3)(iv) and (c) to read as follows:

§ 1039.250 What records must I keep and what reports must I send to EPA?

* * * * *

(b) * * *

(3) * * *

(iv) All your emission tests, including the date and purpose of each test and documentation of test parameters as specified in part 40 CFR part 1065.

* * * * *

(c) Keep required data from emission tests and all other information specified in this section for eight years after we issue your certificate. If you use the same emission data or other information for a later model year, the eight-year

period restarts with each year that you continue to rely on the information.

* * * * *

■ 160. Section 1039.255 is amended by revising paragraphs (c)(2) and (4), (d), and (e) to read as follows:

§ 1039.255 What decisions may EPA make regarding my certificate of conformity?

* * * * *

(c) * * *

(2) Submit false or incomplete information (paragraph (e) of this section applies if this is fraudulent). This includes doing anything after submission of your application to render any of the submitted information false or incomplete.

* * * * *

(4) Deny us from completing authorized activities (see 40 CFR 1068.20). This includes a failure to provide reasonable assistance.

* * * * *

(d) We may void the certificate of conformity for an engine family if you fail to keep records, send reports, or give us information as required under this part or the Act. Note that these are also violations of 40 CFR 1068.101(a)(2).

(e) We may void your certificate if we find that you intentionally submitted false or incomplete information. This includes rendering submitted information false or incomplete after submission.

* * * * *

Subpart F—Test Procedures

■ 161. Section 1039.501 is amended by revising paragraphs (a), (e), (f), and (g) and adding paragraph (h) to read as follows:

§ 1039.501 How do I run a valid emission test?

(a) Use the equipment and procedures for compression-ignition engines in 40 CFR part 1065 to determine whether engines meet the duty-cycle emission standards in subpart B of this part. Measure the emissions of all the exhaust constituents subject to emission standards as specified in 40 CFR part 1065. Measure CO₂, N₂O, and CH₄ as described in § 1039.235. Use the applicable duty cycles specified in §§ 1039.505 and 1039.510.

* * * * *

(e) The following provisions apply for engines using aftertreatment technology with infrequent regeneration events that may occur during testing:

(1) Adjust measured emissions to account for aftertreatment technology with infrequent regeneration as described in § 1039.525.

(2) If your engine family includes engines with one or more emergency AECDs approved under § 1039.115(g)(4) or (5), do not consider additional regenerations resulting from those AECDs when developing adjustments to measured values under this paragraph (e).

(3) Invalidate a smoke test if active regeneration starts to occur during the test.

(f) You may disable any AECDs that have been approved solely for emergency equipment applications under § 1039.115(g)(4). Note that the emission standards do not apply when any of these AECDs are active.

(g) You may use special or alternate procedures to the extent we allow them under 40 CFR 1065.10.

(h) This subpart is addressed to you as a manufacturer, but it applies equally to anyone who does testing for you, and to us when we perform testing to determine if your engines meet emission standards.

■ 162. Section 1039.505 is amended by revising paragraph (b)(2) to read as follows:

§ 1039.505 How do I test engines using steady-state duty cycles, including ramped-modal testing?

* * * * *

(b) * * *

(2) Use the 6-mode duty cycle or the corresponding ramped-modal cycle described in paragraph (b) of Appendix II of this part for variable-speed engines below 19 kW. You may instead use the 8-mode duty cycle or the corresponding ramped-modal cycle described in paragraph (c) of Appendix II of this part if some engines from your engine family will be used in applications that do not involve governing to maintain engine operation around rated speed.

* * * * *

■ 163. Section 1039.515 is amended by revising paragraph (a) to read as follows:

§ 1039.515 What are the test procedures related to not-to-exceed standards?

(a) *General provisions.* The provisions in 40 CFR 86.1370 apply for determining whether an engine meets the not-to-exceed emission standards in § 1039.101(e), except as noted in this section. Interpret references to vehicles and vehicle operation to mean equipment and equipment operation.

* * * * *

■ 164. Section 1039.525 is revised to read as follows:

§ 1039.525 How do I adjust emission levels to account for infrequent regenerating aftertreatment devices?

For engines using aftertreatment technology with infrequent regeneration events that may occur during testing, take one of the following approaches to account for the emission impact of regeneration:

(a) You may use the calculation methodology described in 40 CFR 1065.680 to adjust measured emission results. Do this by developing an upward adjustment factor and a downward adjustment factor for each pollutant based on measured emission data and observed regeneration frequency as follows:

(1) Adjustment factors should generally apply to an entire engine family, but you may develop separate adjustment factors for different configurations within an engine family. Use the adjustment factors from this section for all testing for the engine family.

(2) You may use carryover or carry-across data to establish adjustment factors for an engine family as described in § 1039.235, consistent with good engineering judgment.

(3) For engines that are required to certify to both transient and steady-state duty cycles, calculate a separate adjustment factor for steady-state and transient operation.

(b) You may ask us to approve an alternate methodology to account for regeneration events. We will generally limit approval to cases where your engines use aftertreatment technology with extremely infrequent regeneration and you are unable to apply the provisions of this section.

(c) You may choose to make no adjustments to measured emission results if you determine that regeneration does not significantly affect emission levels for an engine family (or configuration) or if it is not practical to identify when regeneration occurs. If you choose not to make adjustments under paragraph (a) or (b) of this section, your engines must meet emission standards for all testing, without regard to regeneration.

Subpart G—Special Compliance Provisions

■ 165. Section 1039.601 is revised to read as follows:

§ 1039.601 What compliance provisions apply?

(a) Engine and equipment manufacturers, as well as owners, operators, and rebuilders of engines subject to the requirements of this part,

and all other persons, must observe the provisions of this part, the requirements and prohibitions in 40 CFR part 1068, and the provisions of the Act.

(b) Subpart C of this part describes how to test and certify dual-fuel and flexible-fuel engines. Some multi-fuel engines may not fit either of those defined terms. For such engines, we will determine whether it is most appropriate to treat them as single-fuel engines, dual-fuel engines, or flexible-fuel engines based on the range of possible and expected fuel mixtures. For example, an engine might burn natural gas but initiate combustion with a pilot injection of diesel fuel. If the engine is designed to operate with a single fueling algorithm (*i.e.*, fueling rates are fixed at a given engine speed and load condition), we would generally treat it as a single-fuel engine. In this context, the combination of diesel fuel and natural gas would be its own fuel type. If the engine is designed to also operate on diesel fuel alone, we would generally treat it as a dual-fuel engine. If the engine is designed to operate on varying mixtures of the two fuels, we would generally treat it as a flexible-fuel engine. To the extent that requirements vary for the different fuels or fuel mixtures, we may apply the more stringent requirements.

■ 166. Section 1039.605 is amended by revising paragraphs (b), (d)(5), and (d)(8) to read as follows:

§ 1039.605 What provisions apply to engines certified under the motor-vehicle program?

* * * * *

(b) *Equipment-manufacturer provisions.* If you are not an engine manufacturer, you may install motor-vehicle engines certified for the appropriate model year under 40 CFR part 86 in nonroad equipment as long as you meet all the requirements and conditions specified in paragraph (d) of this section. You must also add the fuel-inlet label we specify in § 1039.135(e). If you modify the motor-vehicle engine in any of the ways described in paragraph (d)(2) of this section, we will consider you a manufacturer of a new nonroad engine. Such engine modifications prevent you from using the provisions of this section.

* * * * *

(d) * * *

(5) You must add a permanent supplemental label to the engine in a position where it will remain clearly visible after installation in the equipment. In the supplemental label, do the following:

(i) Include the heading: “NONROAD ENGINE EMISSION CONTROL INFORMATION”.

(ii) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

(iii) State: “THIS ENGINE WAS ADAPTED FOR NONROAD USE WITHOUT AFFECTING ITS EMISSION CONTROLS. THE EMISSION-CONTROL SYSTEM DEPENDS ON THE USE OF FUEL MEETING SPECIFICATIONS THAT APPLY FOR MOTOR-VEHICLE APPLICATIONS. OPERATING THE ENGINE ON OTHER FUELS MAY BE A VIOLATION OF FEDERAL LAW.”

(iv) State the date you finished modifying the engine (month and year), if applicable.

* * * * *

(8) Send the Designated Compliance Officer written notification describing your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated Compliance Officer a signed letter with all the following information:

(i) Identify your full corporate name, address, and telephone number.

(ii) List the engine or equipment models for which you used this exemption in the previous year and describe your basis for meeting the sales restrictions of paragraph (d)(3) of this section.

(iii) State: “We prepared each listed [engine or equipment] model for nonroad application without making any changes that could increase its certified emission levels, as described in 40 CFR 1039.605.”

* * * * *

■ 167. Section 1039.610 is amended by revising paragraphs (d)(5)(ii) and (d)(7) to read as follows:

§ 1039.610 What provisions apply to vehicles certified under the motor-vehicle program?

* * * * *

(d) * * *

(5) * * *

(ii) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

* * * * *

(7) Send the Designated Compliance Officer written notification describing your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated

Compliance Officer a signed letter with all the following information:

(i) Identify your full corporate name, address, and telephone number.

(ii) List the equipment models for which you used this exemption in the previous year and describe your basis for meeting the sales restrictions of paragraph (d)(3) of this section.

(iii) State: “We prepared each listed engine or equipment model for nonroad application without making any changes that could increase its certified emission levels, as described in 40 CFR 1039.610.”

* * * * *

§§ 1039.640 and 1039.660 [Removed]

■ 168. Sections 1039.640 and 1039.660 are removed.

■ 169. A new § 1039.699 is added to subpart G to read as follows:

§ 1039.699 Emission standards and certification requirements for auxiliary power units for highway tractors.

(a) This section describes emission standards and certification requirements for auxiliary power units (APU) installed on highway tractors subject to standards under 40 CFR 1037.106 starting in model year 2024.

(b) You may apply for a certificate of conformity under this section if you manufacture APUs, or if you install emission control hardware to meet the standard in this section.

(c) Exhaust emissions may not exceed a PM standard of 0.02 g/kW-hr when tested using the steady-state test procedures described in subpart F of this part for the duty cycles specified in § 1039.505(b)(1). Your APUs must meet the exhaust emission standards of this section over the engine’s useful life as specified in § 1039.101(g). These emission standards also apply for testing with production and in-use APUs.

(d) The APU is deemed to have a valid certificate of conformity under this section if the engine manufacturer certifies the engine under 40 CFR part 1039 with a family emission limit of 0.02 g/kW-hr or less.

(e) The APU may draw power from the installed engine to regenerate a particulate filter, but you must not make any other changes to the certified engine that could reasonably be expected to increase its emissions of any pollutant.

(f) Sections 1039.115, 1039.120, 1039.125, and 1039.130 apply for APUs as written. You must exercise due diligence in ensuring that your system will not adversely affect safety or otherwise violate the prohibition of § 1039.115(f).

(g) All your APUs are considered to be part of a single emission family; however, you may subdivide your APUs into multiple emission families if you show the expected emission characteristics are different during the useful life.

(h) Testing requirements apply for certification as follows:

(1) Select an emission-data APU representing a worst-case condition for PM emissions. Measure emissions from the test engine with the APU installed according to your specifications.

(2) We may require you to provide an engineering analysis showing that the performance of your emission controls will not deteriorate during the useful life with proper maintenance. If we determine that your emission controls are likely to deteriorate during the useful life, we may require you to develop and apply deterioration factors consistent with good engineering judgment.

(3) Collect emission data and round to the nearest 0.01 g/kW-hr for comparing to the standard. Calculate full-life emissions as described in § 1039.240(d) if you need to apply a deterioration factor.

(4) You may ask to use emission data from a previous production period instead of doing new tests as described in § 1039.235(d).

(5) Additional testing provisions apply as described in § 1039.235(c), (e), and (f).

(i) Your APU certificate is valid for any engine certified under this part 1039, as long as the engine has a maximum engine power no more than 10 percent greater than the maximum engine power of the engine used for certification testing under this section.

(j) The following provisions apply for determining whether your APU complies with the requirements of this section:

(1) For purposes of certification, your emission family is considered in compliance with the emission standards of this section if all emission-data APUs representing that family have test results showing compliance with the standards.

(2) Your engine family is deemed not to comply if any emission-data APU representing that family for certification has test results showing a full-life emission level above the PM standard.

(k) At the time of manufacture, affix a permanent and legible label identifying each APU. This applies even if the engine manufacturer certifies a compliant engine as described in paragraph (d) of this section. The label must meet the specifications described in 40 CFR 1068.45(a). The label must—

(1) Include the heading “EMISSION CONTROL INFORMATION”.

(2) Include your full corporate name and trademark.

(3) State: “THIS APU ENGINE COMPLIES WITH 40 CFR 1039.699.”

(l) [Reserved]

(m) See §§ 1039.201, 1039.210, 1039.220, 1039.225, 1039.250, and 1039.255 for general requirements related to obtaining a certificate of conformity. A certificate issued under this section may apply for a production period lasting up to five years. Include the following information in your application for certification, unless we ask you to include less information:

(1) Describe the emission family's specifications and other basic parameters of the APU's design and emission controls. List each distinguishable configuration in the emission family. For each APU configuration, list the maximum engine power for which the APU is designed to operate.

(2) Explain how the emission control system operates. Identify the part number of each component you describe.

(3) Describe the engines you selected for testing and the reasons for selecting them.

(4) Describe the test equipment and procedures that you used. Also describe any special or alternate test procedures you used.

(5) Describe how you operated the emission-data APU before testing, including any operation to break in the APU or otherwise stabilize emission levels. Describe any scheduled maintenance you did.

(6) List the specifications of the test fuel to show that it falls within the required ranges we specify in 40 CFR part 1065.

(7) Include the maintenance and warranty instructions you will provide (see §§ 1039.120 and 1039.125).

(8) Describe your emission control information label.

(9) Identify the emission family's deterioration factors and describe how you developed them, or summarize your analysis describing why you don't expect performance of emission controls to deteriorate. Present any emission test data you used for this.

(10) State that you operated your emission-data APU as described in the application (including the test procedures, test parameters, and test fuels) to show you meet the requirements of this part.

(11) Present emission data for PM.

(12) Report all test results, including those from invalid tests, whether or not they were conducted according to the

test procedures of subpart F of this part. We may ask you to send other information to confirm that your tests were valid under the requirements of this part and 40 CFR part 1065.

(13) Describe any adjustable operating parameters as described in § 1039.205(s).

(14) Unconditionally certify that all the APUs in the emission family comply with the requirements of this part, other referenced parts of the CFR, and the Clean Air Act.

(15) Provide additional information if we say we need it to evaluate your application.

(16) Name an agent for service located in the United States. Service on this agent constitutes service on you or any of your officers or employees for any action by EPA or otherwise by the United States related to the requirements of this part.

(n) If a highway tractor manufacturer violates 40 CFR 1037.106(g) by installing an APU from you that is not properly certified and labeled, you are presumed to have caused the violation (see 40 CFR 1068.101(c)).

Subpart H—Averaging, Banking, and Trading for Certification

■ 170. Section 1039.701 is amended by adding paragraph (h) to read as follows:

§ 1039.701 General provisions.

* * * * *

(h) You may use either of the following approaches to retire or forego emission credits:

(1) You may retire emission credits generated from any number of your engines. This may be considered donating emission credits to the environment. Identify any such credits in the reports described in § 1039.730. Engines must comply with the applicable FELs even if you donate or sell the corresponding emission credits under this paragraph (h). Those credits may no longer be used by anyone to demonstrate compliance with any EPA emission standards.

(2) You may certify a family using an FEL below the emission standard as described in this part and choose not to generate emission credits for that family. If you do this, you do not need to calculate emission credits for those families and you do not need to submit or keep the associated records described in this subpart for that family.

■ 171. Section 1039.705 is amended by revising paragraphs (b), (c) introductory text, and (c)(1) to read as follows:

§ 1039.705 How do I generate and calculate emission credits?

* * * * *

(b) For each participating family, calculate positive or negative emission credits relative to the otherwise applicable emission standard. Calculate positive emission credits for a family that has an FEL below the standard. Calculate negative emission credits for a family that has an FEL above the standard. Sum your positive and negative credits for the model year before rounding. Round the sum of emission credits to the nearest kilogram (kg), using consistent units throughout the following equation:

$$\text{Emission credits (kg)} = (\text{Std} - \text{FEL}) < (\text{Volume}) < (\text{AvgPR}) < (\text{UL}) < (10^{-3})$$

Where:

Std = the emission standard, in grams per kilowatt-hour, that applies under subpart B of this part for engines not participating in the ABT program of this subpart (the “otherwise applicable standard”).

FEL = the family emission limit for the engine family, in grams per kilowatt-hour.

Volume = the number of engines eligible to participate in the averaging, banking, and trading program within the given engine family during the model year, as described in paragraph (c) of this section.

AvgPR = the average value of maximum engine power values for the engine configurations within an engine family, calculated on a sales-weighted basis, in kilowatts.

UL = the useful life for the given engine family, in hours.

(c) As described in § 1039.730, compliance with the requirements of this subpart is determined at the end of the model year based on actual U.S.-directed production volumes. Do not include any of the following engines to calculate emission credits:

(1) Engines with a permanent exemption under subpart G of this part or under 40 CFR part 1068.

* * * * *

■ 172. Section 1039.710 is amended by revising paragraph (c) to read as follows:

§ 1039.710 How do I average emission credits?

* * * * *

(c) If you certify an engine family to an FEL that exceeds the otherwise applicable standard, you must obtain enough emission credits to offset the engine family’s deficit by the due date for the final report required in § 1039.730. The emission credits used to address the deficit may come from your other engine families that generate emission credits in the same model year, from emission credits you have banked from previous model years, or from emission credits generated in the

same or previous model years that you obtained through trading.

■ 173. Section 1039.725 is amended by revising paragraph (b)(2) to read as follows:

§ 1039.725 What must I include in my application for certification?

* * * * *

(b) * * *

(2) Detailed calculations of projected emission credits (positive or negative) based on projected production volumes. We may require you to include similar calculations from your other engine families to demonstrate that you will be able to avoid negative credit balances for the model year. If you project negative emission credits for a family, state the source of positive emission credits you expect to use to offset the negative emission credits.

■ 174. Section 1039.730 is amended by revising paragraphs (b)(1), (b)(4), (c)(2), and (d) to read as follows:

§ 1039.730 What ABT reports must I send to EPA?

* * * * *

(b) * * *

(1) Engine-family designation and averaging set.

* * * * *

(4) The projected and actual U.S.-directed production volumes for the model year. If you changed an FEL during the model year, identify the actual U.S.-directed production volume associated with each FEL.

* * * * *

(c) * * *

(2) State whether you will retain any emission credits for banking. If you choose to retire emission credits that would otherwise be eligible for banking, identify the engine families that generated the emission credits, including the number of emission credits from each family.

* * * * *

(d) If you trade emission credits, you must send us a report within 90 days after the transaction, as follows:

(1) As the seller, you must include the following information in your report:

(i) The corporate names of the buyer and any brokers.

(ii) A copy of any contracts related to the trade.

(iii) The averaging set corresponding to the engine families that generated emission credits for the trade, including the number of emission credits from each averaging set.

(2) As the buyer, you must include the following information in your report:

(i) The corporate names of the seller and any brokers.

(ii) A copy of any contracts related to the trade.

(iii) How you intend to use the emission credits, including the number of emission credits you intend to apply for each averaging set.

* * * * *

■ 175. Section 1039.735 is amended by revising paragraphs (a) and (b) to read as follows:

§ 1039.735 What records must I keep?

(a) You must organize and maintain your records as described in this section.

(b) Keep the records required by this section for at least eight years after the due date for the end-of-year report. You may not use emission credits for any engines if you do not keep all the records required under this section. You must therefore keep these records to continue to bank valid credits.

* * * * *

■ 176. Section 1039.740 is amended by revising paragraph (a) to read as follows:

§ 1039.740 What restrictions apply for using emission credits?

* * * * *

(a) *Averaging sets.* Emission credits may be exchanged only within an averaging set. For emission credits generated by Tier 4 engines, there are two averaging sets—one for engines at or below 560 kW and another for engines above 560 kW.

* * * * *

Subpart I—Definitions and Other Reference Information

■ 177. Section 1039.801 is amended as follows:

■ a. By revising the definitions of “Aircraft” and “Designated Compliance Officer”.

■ b. By removing the definition for “Designated Enforcement Officer”.

■ c. By adding definitions for “Dual-fuel” and “Flexible-fuel” in alphabetical order.

■ d. By revising paragraph (1)(i) of the definition of “Model year” and the definitions of “Owners manual” and “Placed into service”.

■ e. By removing the definition for “Point of first retail sale”.

■ f. By revising the definition for “Sulfur-sensitive technology”.

The revisions and additions read as follows:

§ 1039.801 What definitions apply to this part?

* * * * *

Aircraft means any vehicle capable of sustained air travel more than 100 feet above the ground.

* * * *

Designated Compliance Officer means the Director, Diesel Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *complianceinfo@epa.gov*; *epa.gov/otaq/verify*.

* * * *

Dual-fuel means relating to an engine designed for operation on two different fuels but not on a continuous mixture of those fuels (see § 1039.601(b)). For purposes of this part, such an engine remains a dual-fuel engine even if it is designed for operation on three or more different fuels.

* * * *

Flexible-fuel means relating to an engine designed for operation on any mixture of two or more different fuels (see § 1039.601(b)).

* * * *

Model year means one of the following things:

(1) * * *

(i) Calendar year of production.

* * * *

Owners manual means a document or collection of documents prepared by the engine manufacturer for the owner or operator to describe appropriate engine maintenance, applicable warranties, and any other information related to operating or keeping the engine. The owners manual is typically provided to the ultimate purchaser at the time of sale. The owners manual may be in paper or electronic format.

* * * *

Placed into service means put into initial use for its intended purpose. Engines and equipment do not qualify as being “placed into service” based on incidental use by a manufacturer or dealer.

* * * *

Sulfur-sensitive technology means an emission control technology that experiences a significant drop in emission control performance or emission-system durability when an engine is operated on low-sulfur diesel fuel (*i.e.*, fuel with a sulfur concentration of 300 to 500 ppm) as compared to when it is operated on ultra-low sulfur diesel fuel (*i.e.*, fuel with a sulfur concentration less than 15 ppm). Exhaust gas recirculation is not a sulfur-sensitive technology.

* * * *

■ 178. Section 1039.815 is revised to read as follows:

§ 1039.815 What provisions apply to confidential information?

The provisions of 40 CFR 1068.10 apply for information you consider confidential.

■ 179. Section 1039.825 is revised to read as follows:

§ 1039.825 What reporting and recordkeeping requirements apply under this part?

(a) This part includes various requirements to submit and record data or other information. Unless we specify otherwise, store required records in any format and on any media and keep them readily available for eight years after you send an associated application for certification, or eight years after you generate the data if they do not support an application for certification. You are expected to keep your own copy of required records rather than relying on someone else to keep records on your behalf. We may review these records at any time. You must promptly send us organized, written records in English if we ask for them. We may require you to submit written records in an electronic format.

(b) The regulations in § 1039.255, 40 CFR 1068.25, and 40 CFR 1068.101 describe your obligation to report truthful and complete information. This includes information not related to certification. Failing to properly report information and keep the records we specify violates 40 CFR 1068.101(a)(2), which may involve civil or criminal penalties.

(c) Send all reports and requests for approval to the Designated Compliance Officer (see § 1039.801).

(d) Any written information we require you to send to or receive from another company is deemed to be a required record under this section. Such records are also deemed to be submissions to EPA. We may require you to send us these records whether or not you are a certificate holder.

(e) Under the Paperwork Reduction Act (44 U.S.C. 3501 et seq), the Office of Management and Budget approves the reporting and recordkeeping specified in the applicable regulations. The following items illustrate the kind of reporting and recordkeeping we require for engines and equipment regulated under this part:

(1) We specify the following requirements related to engine certification in this part 1039:

(i) In § 1039.20 we require engine manufacturers to label stationary engines that do not meet the standards in this part.

(ii) In § 1039.135 we require engine manufacturers to keep certain records

related to duplicate labels sent to equipment manufacturers.

(iii) [Reserved]

(iv) In subpart C of this part we identify a wide range of information required to certify engines.

(v) [Reserved]

(vi) In subpart G of this part we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various special compliance provisions. For example, equipment manufacturers must submit reports and keep records related to the flexibility provisions in § 1039.625.

(vii) In § 1039.725, 1039.730, and 1039.735 we specify certain records related to averaging, banking, and trading.

(2) We specify the following requirements related to testing in 40 CFR part 1065:

(i) In 40 CFR 1065.2 we give an overview of principles for reporting information.

(ii) In 40 CFR 1065.10 and 1065.12 we specify information needs for establishing various changes to published test procedures.

(iii) In 40 CFR 1065.25 we establish basic guidelines for storing test information.

(iv) In 40 CFR 1065.695 we identify the specific information and data items to record when measuring emissions.

(3) We specify the following requirements related to the general compliance provisions in 40 CFR part 1068:

(i) In 40 CFR 1068.5 we establish a process for evaluating good engineering judgment related to testing and certification.

(ii) In 40 CFR 1068.25 we describe general provisions related to sending and keeping information.

(iii) In 40 CFR 1068.27 we require manufacturers to make engines available for our testing or inspection if we make such a request.

(iv) In 40 CFR 1068.105 we require equipment manufacturers to keep certain records related to duplicate labels from engine manufacturers.

(v) In 40 CFR 1068.120 we specify recordkeeping related to rebuilding engines.

(vi) In 40 CFR part 1068, subpart C, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various exemptions.

(vii) In 40 CFR part 1068, subpart D, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to importing engines.

(viii) In 40 CFR 1068.450 and 1068.455 we specify certain records

related to testing production-line engines in a selective enforcement audit.

(ix) In 40 CFR 1068.501 we specify certain records related to investigating and reporting emission-related defects.

(x) In 40 CFR 1068.525 and 1068.530 we specify certain records related to recalling nonconforming engines.

(xi) In 40 CFR part 1068, subpart G, we specify certain records for requesting a hearing.

PART 1042—CONTROL OF EMISSIONS FROM NEW AND IN-USE MARINE COMPRESSION-IGNITION ENGINES AND VESSELS

■ 180. The authority citation for part 1042 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Overview and Applicability

■ 181. Section 1042.1 is amended by revising paragraphs (a) and (c) introductory text to read as follows:

§ 1042.1 Applicability.

* * * * *

(a) The emission standards of this part 1042 for freshly manufactured engines apply for new marine engines starting with the model years noted in the following table:

TABLE 1 TO § 1042.1—PART 1042 APPLICABILITY BY MODEL YEAR

Engine category	Maximum engine power ^a	Displacement (L/cyl) or application	Model year
Category 1	kW < 75	disp. < 0.9	^b 2009
		disp. < 0.9	2012
		0.9 ≤ disp. < 1.2	2013
		1.2 ≤ disp. < 2.5	2014
		2.5 ≤ disp. < 3.5	2013
		3.5 ≤ disp. < 7.0	2012
		All	2014
Category 2	kW > 3700	7.0 ≤ disp. < 15.0	2013
	kW ≤ 3700	7.0 ≤ disp. < 15.0	2014
	kW > 3700	15 ≤ disp. < 30	2014
Category 3	All	disp. ≥ 30	2011

^a See § 1042.140, which describes how to determine maximum engine power.

^b See Table 1 of § 1042.101 for the first model year in which this part 1042 applies for engines with maximum engine power below 75 kW and displacement at or above 0.9 L/cyl.

* * * * *

(c) Freshly manufactured engines with maximum engine power at or above 37 kW and originally manufactured and certified before the model years identified in Table 1 to this section are subject to emission standards and requirements of 40 CFR part 94. The provisions of this part 1042 do not apply for such engines certified under 40 CFR part 94, except as follows beginning June 29, 2010:

* * * * *

■ 182. Section 1042.2 is revised to read as follows:

§ 1042.2 Who is responsible for compliance?

The regulations in this part 1042 contain provisions that affect both engine manufacturers and others. However, the requirements of this part, other than those of subpart I of this part, are generally addressed to the engine manufacturer for freshly manufactured marine engines or other certificate holders. The term “you” generally means the engine manufacturer, as

defined in § 1042.901, especially for issues related to certification (including production-line testing, reporting, etc.). Note that for engines that become new after being placed into service (such as engines converted from highway or stationary use, or engines installed on vessels that are reflagged to become U.S. vessels), the requirements that normally apply for manufacturers of freshly manufactured engines apply to the importer or any other entity we allow to obtain a certificate of conformity.

■ 183. Section 1042.30 is revised to read as follows:

§ 1042.30 Submission of information.

Unless we specify otherwise, send all reports and requests for approval to the Designated Compliance Officer (see § 1042.901). See § 1042.925 for additional reporting and recordkeeping provisions.

Subpart B—Emission Standards and Related Requirements

■ 184. Section 1042.101 is amended by revising the section heading and

paragraphs (a), (b), (c), and (d)(1)(ii) to read as follows:

§ 1042.101 Exhaust emission standards for Category 1 and Category 2 engines.

(a) *Duty-cycle standards.* Exhaust emissions from your engines may not exceed emission standards, as follows:

(1) Measure emissions using the test procedures described in subpart F of this part.

(2) The following CO emission standards in this paragraph (a)(2) apply starting with the applicable model year identified in § 1042.1:

(i) 8.0 g/kW-hr for engines below 8 kW.

(ii) 6.6 g/kW-hr for engines at or above 8 kW and below 19 kW.

(iii) 5.5 g/kW-hr for engines at or above 19 kW and below 37 kW.

(iv) 5.0 g/kW-hr for engines at or above 37 kW.

(3) Except as described in paragraphs (a)(4) and (5) of this section, the Tier 3 standards for PM and NO_x+HC emissions are described in the following tables:

TABLE 1 TO § 1042.101—TIER 3 STANDARDS FOR CATEGORY 1 ENGINES BELOW 3700 kW^a

Power density and application	Displacement (L/cyl)	Maximum engine power	Model year	PM (g/kW-hr)	NO _x +HC (g/kW-hr) ^b
All	disp. < 0.9	kW < 19	2009+	0.40	7.5
		19 ≤ kW < 75	2009–2013	0.30	7.5
			2014+	^c 0.30	^c 4.7

TABLE 1 TO § 1042.101—TIER 3 STANDARDS FOR CATEGORY 1 ENGINES BELOW 3700 kW^a—Continued

Power density and application	Displacement (L/cyl)	Maximum engine power	Model year	PM (g/kW-hr)	NO _x +HC (g/kW-hr) ^b
Commercial engines with kW/L ≤ 35	disp. < 0.9	kW ≥ 75	2012+	0.14	5.4
	0.9 ≤ disp. < 1.2	all	2013+	0.12	5.4
	1.2 ≤ disp. < 2.5	kW < 600	2014–2017	0.11	5.6
			2018+	0.10	5.6
		kW ≥ 600	2014+	0.11	5.6
	2.5 ≤ disp. < 3.5	kW < 600	2013–2017	0.11	5.6
			2018+	0.10	5.6
		kW ≥ 600	2013+	0.11	5.6
	3.5 ≤ disp. < 7.0	kW < 600	2012–2017	0.11	5.8
			2018+	0.10	5.8
Commercial engines with kW/L > 35, and all recreational engines ≥ 75 kW.	disp. < 0.9	kW ≥ 600	2012+	0.11	5.8
		kW ≥ 75	2012+	0.15	5.8
	0.9 ≤ disp. < 1.2	all	2013+	0.14	5.8
	1.2 ≤ disp. < 2.5		2014+	0.12	5.8
	2.5 ≤ disp. < 3.5		2013+	0.12	5.8
	3.5 ≤ disp. < 7.0		2012+	0.11	5.8

^aNo Tier 3 standards apply for commercial Category 1 engines at or above 3700 kW. See § 1042.1(c) and paragraph (a)(7) of this section for the standards that apply for these engines.

^bThe applicable NO_x+HC standards specified for Tier 2 engines in Appendix I of this part continue to apply instead of the values noted in the table for commercial engines at or above 2000 kW. FELs for these engines may not be higher than the Tier 1 NO_x standard specified in Appendix I of this part.

^cSee paragraph (a)(4) of this section for alternative PM and NO_x+HC standards for engines at or above 19 kW and below 75 kW with displacement below 0.9 L/cyl.

TABLE 2 TO § 1042.101— TIER 3 STANDARDS FOR CATEGORY 2 ENGINES BELOW 3700 kW^a

Displacement (L/cyl)	Maximum engine power	Model year	PM (g/kW-hr)	NO _x +HC (g/kW-hr)
7.0 ≤ disp. < 15.0	kW < 2000	2013+	0.14	6.2
	2000 ≤ kW ≤ 3700	2013+	0.14	^b 7.8
15.0 ≤ disp. < 20.0 ^c	kW < 2000	2014+	0.34	7.0
20.0 ≤ disp. < 25.0 ^c	kW < 2000	2014+	0.27	9.8
25.0 ≤ disp. < 30.0 ^c	kW < 2000	2014+	0.27	11.0

^aThe Tier 3 standards in this table do not apply for Category 2 engines at or above 2000 kW with per-cylinder displacement at or above 15.0 liters, or for any Category 2 engines at or above 3700 kW. See § 1042.1(c) and paragraphs (a)(6) through (8) of this section for the standards that apply for these engines.

^bFor engines subject to the 7.8 g/kW-hr NO_x+HC standard, FELs may not be higher than the Tier 1 NO_x standards specified in Appendix I of this part.

^cThere are no Tier 3 standards for Category 2 engines with per-cylinder displacement at or above 15 and 20 liters with maximum engine power at or above 2000 kW. See paragraphs (a)(6) and (7) of this section for the Tier 4 standards that apply for these engines starting with the 2014 model year.

(4) For Tier 3 engines at or above 19 kW and below 75 kW with displacement below 0.9 L/cyl, you may alternatively certify some or all of your engine families to a PM emission standard of 0.20 g/kW-hr and a NO_x+HC emission standard of 5.8 g/kW-hr for 2014 and later model years.

(5) Starting with the 2014 model year, recreational marine engines at or above 3700 kW (with any displacement) must be certified under this part 1042 to the Tier 3 standards specified in this section for 3.5 to 7.0 L/cyl recreational marine engines.

(6) Interim Tier 4 p.m. standards apply for 2014 and 2015 model year engines between 2000 and 3700 kW as specified in this paragraph (a)(6). These engines are considered to be Tier 4 engines.

(i) For Category 1 engines, the Tier 3 p.m. standards from Table 1 to this section continue to apply. PM FELs for these engines may not be higher than the applicable Tier 2 p.m. standards specified in Appendix I of this part.

(ii) For Category 2 engines with per-cylinder displacement below 15.0 liters, the Tier 3 p.m. standards from Table 2 to this section continue to apply. PM

FELs for these engines may not be higher than 0.27 g/kW-hr.

(iii) For Category 2 engines with per-cylinder displacement at or above 15.0 liters, the PM standard is 0.34 g/kW-hr for engines at or above 2000 kW and below 3300 kW, and 0.27 g/kW-hr for engines at or above 3300 kW and below 3700 kW. PM FELs for these engines may not be higher than 0.50 g/kW-hr.

(7) Except as described in paragraph (a)(8) of this section, the Tier 4 standards for PM, NO_x, and HC emissions are described in the following table:

TABLE 3 TO § 1042.101—TIER 4 STANDARDS FOR CATEGORY 2 AND COMMERCIAL CATEGORY 1 ENGINES AT OR ABOVE 600 kW

Maximum engine power	Displacement (L/cyl)	Model year	PM (g/kW-hr)	NO _x (g/kW-hr)	HC (g/kW-hr)
600 ≤ kW < 1400	all	2017+	0.04	1.8	0.19

TABLE 3 TO § 1042.101—TIER 4 STANDARDS FOR CATEGORY 2 AND COMMERCIAL CATEGORY 1 ENGINES AT OR ABOVE 600 kW—Continued

Maximum engine power	Displacement (L/cyl)	Model year	PM (g/kW-hr)	NO _x (g/kW-hr)	HC (g/kW-hr)
1400 ≤ kW < 2000	all	2016+	0.04	1.8	0.19
2000 ≤ kW ≤ 3700 ^a	all	2014+	0.04	1.8	0.19
kW > 3700	disp. < 15.0	2014–2015	0.12	1.8	0.19
	15.0 ≤ disp. < 30.0	2014–2015	0.25	1.8	0.19
	all	2016+	0.06	1.8	0.19

^aSee paragraph (a)(6) of this section for interim PM standards that apply for model years 2014 and 2015 for engines between 2000 and 3700 kW. The Tier 4 NO_x FEL cap for engines at or above 2000 kW and below 3700 kW is 7.0 g/kW-hr. Starting in the 2016 model year, the Tier 4 PM FEL cap for engines at or above 2000 kW and below 3700 kW is 0.34 g/kW-hr.

(8) The following optional provisions apply for complying with the Tier 3 and Tier 4 standards specified in paragraphs (a)(3) through (7) of this section:

(i) You may use NO_x credits accumulated through the ABT program to certify Tier 4 engines to a NO_x+HC emission standard of 1.9 g/kW-hr instead of the NO_x and HC standards that would otherwise apply by certifying your family to a NO_x+HC FEL. Calculate the NO_x credits needed as specified in subpart H of this part using the NO_x+HC emission standard and FEL in the calculation instead of the otherwise applicable NO_x standard and

FEL. You may not generate credits relative to the alternate standard or certify to the standard without using credits.

(ii) For engines below 1000 kW, you may delay complying with the Tier 4 standards in the 2017 model year for up to nine months, but you must comply no later than October 1, 2017.

(iii) For engines at or above 3700 kW, you may delay complying with the Tier 4 standards in the 2016 model year for up to twelve months, but you must comply no later than December 31, 2016.

(iv) For Category 2 engines at or above 1400 kW, you may alternatively comply with the Tier 3 and Tier 4 standards specified in Table 4 of this section instead of the NO_x, HC, NO_x+HC, and PM standards specified in paragraphs (a)(3) through (7) of this section. The CO standards specified in paragraph (a)(2) of this section apply without regard to whether you choose this option. If you choose this option, you must do so for all engines at or above 1400 kW in the same displacement category (that is, 7–15, 15–20, 20–25, or 25–30 liters per cylinder) in model years 2012 through 2015.

TABLE 4 TO § 1042.101—OPTIONAL TIER 3 AND TIER 4 STANDARDS FOR CATEGORY 2 ENGINES AT OR ABOVE 1400 kW

Tier	Maximum engine power	Model year	PM (g/kW-hr)	NO _x (g/kW-hr)	HC (g/kW-hr)
Tier 3	kW ≥ 1400	2012–2014	0.14	7.8 NO _x +HC
Tier 4	1400 ≤ kW ≤ 3700	2015	0.04	1.8	0.19
	kW > 3700	2015	0.06	1.8	0.19

(b) *Averaging, banking, and trading.* You may generate or use emission credits under the averaging, banking, and trading (ABT) program as described in subpart H of this part for demonstrating compliance with NO_x, NO_x+HC, and PM emission standards for Category 1 and Category 2 engines. You may also use NO_x or NO_x+HC emission credits to comply with the alternate NO_x+HC standard in paragraph (a)(8)(i) of this section. Generating or using emission credits requires that you specify a family emission limit (FEL) for each pollutant you include in the ABT program for each engine family. These FELs serve as the emission standards for the engine family with respect to all required testing instead of the standards specified in paragraph (a) of this section. The FELs determine the not-to-exceed standards for your engine family, as specified in paragraph (c) of this section. Unless otherwise specified, the following FEL caps apply:

(1) FELs for Tier 3 engines may not be higher than the applicable Tier 2 standards specified in Appendix I of this part.

(2) FELs for Tier 4 engines may not be higher than the applicable Tier 3 standards specified in paragraph (a)(3) of this section.

(3) The following FEL caps apply for engines at or above 3700 kW that are not subject to Tier 3 standards under paragraph (a)(3) of this section:

(i) FELs may not be higher than the applicable Tier 1 NO_x standards specified in Appendix I of this part before the Tier 4 standards start to apply.

(ii) FELs may not be higher than the applicable Tier 2 NO_x+THC standards specified in Appendix I of this part after the Tier 4 standards start to apply.

(c) *Not-to-exceed standards.* Except as noted in § 1042.145(e), exhaust emissions from all engines subject to the requirements of this part may not exceed the not-to-exceed (NTE) standards as follows:

(1) Use the following equation to determine the NTE standards:

(i) NTE standard for each pollutant = STD × M.

Where:

STD = The standard specified for that pollutant in this section if you certify without using ABT for that pollutant; or the FEL for that pollutant if you certify using ABT.

M = The NTE multiplier for that pollutant.

(ii) Round each NTE standard to the same number of decimal places as the emission standard.

(2) Determine the applicable NTE zone and subzones as described in § 1042.515. Determine NTE multipliers for specific zones and subzones and pollutants as follows:

(i) For marine engines certified using the duty cycle specified in § 1042.505(b)(1), except for variable-speed propulsion marine engines used with controllable-pitch propellers or with electrically coupled propellers, apply the following NTE multipliers:

(A) Subzone 1: 1.2 for Tier 3 NO_x+HC standards.

(B) Subzone 1: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards.

(C) Subzone 2: 1.5 for Tier 4 NO_x and HC standards and for Tier 3 NO_x+HC standards.

(D) Subzone 2: 1.9 for PM and CO standards.

(ii) For recreational marine engines certified using the duty cycle specified in § 1042.505(b)(2), except for variable-speed marine engines used with controllable-pitch propellers or with electrically coupled propellers, apply the following NTE multipliers:

(A) Subzone 1: 1.2 for Tier 3 NO_x+HC standards.

(B) Subzone 1: 1.5 for Tier 3 p.m. and CO standards.

(C) Subzones 2 and 3: 1.5 for Tier 3 NO_x+HC standards.

(D) Subzones 2 and 3: 1.9 for PM and CO standards.

(iii) For variable-speed marine engines used with controllable-pitch propellers or with electrically coupled propellers that are certified using the duty cycle specified in § 1042.505(b)(1), (2), or (3), apply the following NTE multipliers:

(A) Subzone 1: 1.2 for Tier 3 NO_x+HC standards.

(B) Subzone 1: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards.

(C) Subzone 2: 1.5 for Tier 4 NO_x and HC standards and for Tier 3 NO_x+HC standards.

(D) Subzone 2: 1.9 for PM and CO standards. However, there is no NTE standard in Subzone 2b for PM emissions if the engine family's applicable standard for PM is at or above 0.07 g/kW-hr.

(iv) For constant-speed engines certified using a duty cycle specified in § 1042.505(b)(3) or (4), apply the following NTE multipliers:

(A) Subzone 1: 1.2 for Tier 3 NO_x+HC standards.

(B) Subzone 1: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards.

(C) Subzone 2: 1.5 for Tier 4 NO_x and HC standards and for Tier 3 NO_x+HC standards.

(D) Subzone 2: 1.9 for PM and CO standards. However, there is no NTE standard for PM emissions if the engine family's applicable standard for PM is at or above 0.07 g/kW-hr.

(v) For variable-speed auxiliary marine engines certified using the duty cycle specified in § 1042.505(b)(5)(ii) or (iii):

(A) Subzone 1: 1.2 for Tier 3 NO_x+HC standards.

(B) Subzone 1: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards.

(C) Subzone 2: 1.2 for Tier 3 NO_x+HC standards.

(D) Subzone 2: 1.5 for Tier 4 standards and Tier 3 p.m. and CO standards. However, there is no NTE standard for PM emissions if the engine family's applicable standard for PM is at or above 0.07 g/kW-hr.

(3) The NTE standards apply to your engines whenever they operate within the NTE zone for an NTE sampling period of at least thirty seconds, during which only a single operator demand set point may be selected. Engine operation during a change in operator demand is excluded from any NTE sampling period. There is no maximum NTE sampling period.

(4) Collect emission data for determining compliance with the NTE standards using the procedures described in subpart F of this part.

(5) You may ask us to accept as compliant an engine that does not fully meet specific requirements under the applicable NTE standards where such deficiencies are necessary for safety.

(d) * * *

(1) * * *

(ii) Gaseous-fueled engines must comply with HC standards based on nonmethane-nonethane hydrocarbon emissions.

* * * * *

■ 185. Section 1042.104 is amended by revising paragraph (a)(2) to read as follows:

§ 1042.104 Exhaust emission standards for Category 3 engines.

(a) * * *

(2) NO_x standards apply based on the engine's model year and maximum in-use engine speed as shown in the following table:

TABLE 1 TO § 1042.104—NO_x EMISSION STANDARDS FOR CATEGORY 3 ENGINES (G/KW-HR)

Emission standards	Model year	Maximum in-use engine speed		
		Less than 130 RPM	130–2000 RPM ^a	Over 2000 RPM
Tier 1	2004–2010 ^b	17.0	$45.0 \cdot n^{(-0.20)} \dots$	9.8
Tier 2	2011–2015	14.4	$44.0 \cdot n^{(-0.23)} \dots$	7.7
Tier 3 ^c	2016 and later	3.4	$9.0 \cdot n^{(-0.20)} \dots$	2.0

^a Applicable standards are calculated from n (maximum in-use engine speed, in RPM, as specified in § 1042.140). Round the standards to one decimal place.

^b Tier 1 NO_x standards apply as specified in 40 CFR part 94 for engines originally manufactured in model years 2004 through 2010. They are shown here only for reference.

^c For engines designed with on-off controls as specified in § 1042.115(g), the Tier 2 standards continue to apply any time the engine has disabled its Tier 3 NO_x emission controls.

* * *

■ 186. Section 1042.110 is amended by revising paragraphs (a)(1) and (d) and removing and reserving paragraph (b). The revisions read as follows:

§ 1042.110 Recording reductant use and other diagnostic functions.

(a) * * *

(1) The diagnostic system must monitor reductant quality and tank levels and alert operators to the need to refill the reductant tank before it is empty, or to replace the reductant if it

does not meet your concentration specifications. Unless we approve other alerts, use a malfunction-indicator light (MIL) and an audible alarm. You do not need to separately monitor reductant quality if your system uses input from an exhaust NO_x sensor (or other sensor) to alert operators when reductant quality is inadequate. However, tank level must be monitored in all cases.

* * *

(d) For Category 3 engines equipped with on-off NO_x controls (as allowed by

§ 1042.115(g)), you must also equip your engine to continuously monitor NO_x concentrations in the exhaust. See § 1042.650 to determine if this requirement applies for a given Category 1 or Category 2 engine. For measurement technologies involving discrete sampling events, measurements are considered continuous if they repeat at least once every 60 seconds; we may approve a longer sampling period if it is necessary or appropriate for sufficiently accurate measurements. Describe your

system for onboard NO_x measurements in your application for certification. Use good engineering judgment to alert operators if measured NO_x concentrations indicate malfunctioning emission controls. Record any such operation in nonvolatile computer memory. You are not required to monitor NO_x concentrations during operation for which the emission controls may be disabled under § 1042.115(g). For the purpose of this paragraph (d), “malfunctioning emission controls” means any condition in which the measured NO_x concentration exceeds the highest value expected when the engine is in compliance with the installed engine standard of § 1042.104(g). Use good engineering judgment to determine these expected values during production-line testing of the engine using linear interpolation between test points and accounting for the degree to which the cycle-weighted emissions of the engine are below the standard. You may also use additional intermediate test points measured during the production-line test. Note that the provisions of paragraph (a) of this section also apply for SCR systems covered by this paragraph (d). For engines subject to both the provisions of paragraph (a) of this section and this paragraph (d), use good engineering judgment to integrate diagnostic features to comply with both paragraphs. For example, engines may use on-off NO_x controls to disable certain emission control functions only if the diagnostic system indicates that the monitoring described in this paragraph (d) is active.

■ 187. Section 1042.120 is amended by revising paragraph (b) introductory text to read as follows:

§ 1042.120 Emission-related warranty requirements.

(b) *Warranty period.* Your emission-related warranty must be valid for at least as long as the minimum warranty periods listed in this paragraph (b) in hours of operation and years, whichever comes first. You may offer an emission-related warranty more generous than we require. The emission-related warranty for the engine may not be shorter than any basic mechanical warranty you provide without charge for the engine. Similarly, the emission-related warranty for any component may not be shorter than any warranty you provide without charge for that component. This means that your warranty may not treat emission-related and nonemission-related defects differently for any component. If an engine has no hour meter, we base the warranty periods in

this paragraph (b) only on the engine’s age (in years). The warranty period begins when the engine is placed into service. The following minimum warranty periods apply:

* * * * *

■ 188. Section 1042.125 is amended by revising paragraphs (a)(2)(i), (a)(3)(i), (c), (e), and (f) introductory text to read as follows:

§ 1042.125 Maintenance instructions.

* * * * *

(a) * * *

(2) * * *

(i) For EGR-related filters and coolers, DEF filters, crankcase ventilation valves and filters, and fuel injector tips (cleaning only), the minimum interval is 1,500 hours.

* * * * *

(3) * * *

(i) For EGR-related filters and coolers, DEF filters, crankcase ventilation valves and filters, and fuel injector tips (cleaning only), the minimum interval is 1,500 hours.

* * * * *

(c) *Special maintenance.* You may specify more frequent maintenance to address problems related to special situations, such as atypical engine operation. You must clearly state that this additional maintenance is associated with the special situation you are addressing. You may also address maintenance of low-use engines (such as recreational or stand-by engines) by specifying the maintenance interval in terms of calendar months or years in addition to your specifications in terms of engine operating hours. All special maintenance instructions must be consistent with good engineering judgment. We may disapprove your maintenance instructions if we determine that you have specified special maintenance steps to address maintenance that is unlikely to occur in use, or engine operation that is not atypical. For example, this paragraph (c) does not allow you to design engines that require special maintenance for a certain type of expected operation. If we determine that certain maintenance items do not qualify as special maintenance under this paragraph (c), you may identify this as recommended additional maintenance under paragraph (b) of this section.

* * * * *

(e) *Maintenance that is not emission-related.* For maintenance unrelated to emission controls, you may schedule any amount of inspection or maintenance. You may also take these inspection or maintenance steps during service accumulation on your emission-

data engines, as long as they are reasonable and technologically necessary. This might include adding engine oil, changing air, fuel, or oil filters, servicing engine-cooling systems, and adjusting idle speed, governor, engine bolt torque, valve lash, or injector lash. You may not perform this nonemission-related maintenance on emission-data engines more often than the least frequent intervals that you recommend to the ultimate purchaser.

(f) *Source of parts and repairs.* State clearly in your written maintenance instructions that a repair shop or person of the owner’s choosing may maintain, replace, or repair emission control devices and systems. Your instructions may not require components or service identified by brand, trade, or corporate name. Also, do not directly or indirectly condition your warranty on a requirement that the engine be serviced by your franchised dealers or any other service establishments with which you have a commercial relationship. You may disregard the requirements in this paragraph (f) if you do one of two things:

* * * * *

■ 189. Section 1042.130 is amended by revising paragraph (b) to read as follows:

§ 1042.130 Installation instructions for vessel manufacturers.

* * * * *

(b) Make sure these instructions have the following information:

(1) Include the heading: “Emission-related installation instructions”.

(2) State: “Failing to follow these instructions when installing a certified engine in a vessel violates federal law (40 CFR 1068.105(b)), subject to fines or other penalties as described in the Clean Air Act.”

(3) Describe the instructions needed to properly install the exhaust system and any other components. Include instructions consistent with the requirements of § 1042.205(u).

(4) Describe any necessary steps for installing the diagnostic system described in § 1042.110.

(5) Describe how your certification is limited for any type of application. . For example, if your engines are certified only for constant-speed operation, tell vessel manufacturers not to install the engines in variable-speed applications or modify the governor.

(6) Describe any other instructions to make sure the installed engine will operate according to design specifications in your application for certification. This may include, for example, instructions for installing aftertreatment devices when installing the engines.

(7) State: “If you install the engine in a way that makes the engine’s emission control information label hard to read during normal engine maintenance, you must place a duplicate label on the vessel, as described in 40 CFR 1068.105.”

(8) Describe any vessel labeling requirements specified in § 1042.135.

* * * * *

■ 190. Section 1042.135 is amended by revising paragraphs (b), (c), (d)(1), and (e) introductory text to read as follows:

§ 1042.135 Labeling.

* * * * *

(b) At the time of manufacture, affix a permanent and legible label identifying each engine. The label must meet the requirements of 40 CFR 1068.45.

(c) The label must—

(1) Include the heading “EMISSION CONTROL INFORMATION”.

(2) Include your full corporate name and trademark. You may identify another company and use its trademark instead of yours if you comply with the branding provisions of 40 CFR 1068.45.

(3) Include EPA’s standardized designation for the engine family (and subfamily, where applicable).

(4) Identify all the emission standards that apply to the engine (or FELs, if applicable). If you do not declare an FEL under subpart H of this part, you may alternatively state the engine’s category, displacement (in liters or L/cyl), maximum engine power (in kW), and power density (in kW/L) as needed to determine the emission standards for the engine family. You may specify displacement, maximum engine power, or power density as a range consistent with the ranges listed in § 1042.101. See § 1042.140 for descriptions of how to specify per-cylinder displacement, maximum engine power, and power density.

(5) State the date of manufacture [DAY (optional), MONTH, and YEAR]; however, you may omit this from the label if you stamp, engrave, or otherwise permanently identify it elsewhere on the engine, in which case you must also describe in your application for certification where you will identify the date on the engine.

(6) Identify the application(s) for which the engine family is certified (such as constant-speed auxiliary, variable-speed propulsion engines used with fixed-pitch propellers, etc.). If the engine is certified as a recreational engine, state: “INSTALLING THIS RECREATIONAL ENGINE IN A COMMERCIAL VESSEL OR USING THE VESSEL FOR COMMERCIAL

PURPOSES MAY VIOLATE FEDERAL LAW SUBJECT TO CIVIL PENALTY (40 CFR 1042.601).”

(7) For engines using sulfur-sensitive technologies, state: “ULTRA LOW SULFUR DIESEL FUEL ONLY”.

(8) State the useful life for your engine family if the applicable useful life is based on the provisions of § 1042.101(e)(2) or (3), or § 1042.104(d)(2).

(9) Identify the emission control system. Use terms and abbreviations as described in 40 CFR 1068.45. You may omit this information from the label if there is not enough room for it and you put it in the owners manual instead.

(10) State: “THIS MARINE ENGINE COMPLIES WITH U.S. EPA REGULATIONS FOR [MODEL YEAR].”

(11) For a Category 1 or Category 2 engine that can be modified to operate on residual fuel, but has not been certified to meet the standards on such a fuel, include the statement: “THIS ENGINE IS CERTIFIED FOR OPERATION ONLY WITH DIESEL FUEL. MODIFYING THE ENGINE TO OPERATE ON RESIDUAL OR INTERMEDIATE FUEL MAY BE A VIOLATION OF FEDERAL LAW SUBJECT TO CIVIL PENALTIES.”

(12) For an engine equipped with on-off emission controls as allowed by § 1042.115, include the statement: “THIS ENGINE IS CERTIFIED WITH ON-OFF EMISSION CONTROLS. OPERATION OF THE ENGINE CONTRARY TO 40 CFR 1042.115(g) IS A VIOLATION OF FEDERAL LAW SUBJECT TO CIVIL PENALTIES.”

(13) For engines intended for installation on domestic or public vessels, include the following statement: “THIS ENGINE DOES NOT COMPLY WITH INTERNATIONAL MARINE REGULATIONS FOR COMMERCIAL VESSELS UNLESS IT IS ALSO COVERED BY AN EIAPP CERTIFICATE.”

(d) * * *

(1) You may identify other emission standards that the engine meets or does not meet (such as international standards), as long as this does not cause you to omit any of the information described in paragraphs (c)(5) through (9) of this section. You may add the information about the other emission standards to the statement we specify, or you may include it in a separate statement.

* * * * *

(e) For engines using sulfur-sensitive technologies, create a separate label with the statement: “ULTRA LOW SULFUR DIESEL FUEL ONLY”. Permanently attach this label to the

vessel near the fuel inlet or, if you do not manufacture the vessel, take one of the following steps to ensure that the vessel will be properly labeled:

* * * * *

■ 191. Section 1042.140 is amended by revising paragraph (e) to read as follows:

§ 1042.140 Maximum engine power, displacement, power density, and maximum in-use engine speed.

* * * * *

(e) Throughout this part, references to a specific power value for an engine are based on maximum engine power. For example, the group of engines with maximum engine power below 600 kW may be referred to as engines below 600 kW.

* * * * *

Subpart C—Certifying Engine Families

■ 192. Section 1042.201 is amended by revising paragraphs (a) and (g) to read as follows:

§ 1042.201 General requirements for obtaining a certificate of conformity.

(a) You must send us a separate application for a certificate of conformity for each engine family. A certificate of conformity is valid for new production from the indicated effective date until the end of the model year for which it is issued, which may not extend beyond December 31 of that year. No certificate will be issued after December 31 of the model year. You may amend your application for certification after the end of the model year in certain circumstances as described in §§ 1042.220 and 1042.225. You must renew your certification annually for any engines you continue to produce.

* * * * *

(g) We may require you to deliver your test engines to a facility we designate for our testing (see § 1042.235(c)). Alternatively, you may choose to deliver another engine that is identical in all material respects to the test engine, or another engine that we determine can appropriately serve as an emission-data engine for the engine family.

* * * * *

■ 193. Section 1042.205 is amended by revising paragraphs (g), (o), (r)(1), and (bb)(1) to read as follows:

§ 1042.205 Application requirements.

* * * * *

(g) List the specifications of the test fuel (or mixture of test fuels) to show that they fall within the required ranges we specify in 40 CFR part 1065.

* * * * *

(o) Present emission data for HC, NO_x, PM, and CO on an emission-data engine to show your engines meet emission standards as specified in §§ 1042.101 or 1042.104. Note that you must submit PM data for all engines, whether or not a PM standard applies. Show emission figures before and after applying adjustment factors for regeneration and deterioration factors for each pollutant and for each engine. If we specify more than one grade of any fuel type (for example, high-sulfur and low-sulfur diesel fuel), you need to submit test data only for one grade, unless the regulations of this part specify otherwise for your engine. Include emission results for each mode for Category 3 engines or for other engines if you do discrete-mode testing under § 1042.505. For engines using on-off controls as described in § 1042.115(g), include emission data demonstrating compliance with the Tier 2 standards when the engines Tier 3 NO_x emission controls are disabled. Note that §§ 1042.235 and 1042.245 allows you to submit an application in certain cases without new emission data.

* * * * *

(r) * * *

(1) Report all valid test results involving measurement of pollutants for which emission standards apply. Also indicate whether there are test results from invalid tests or from any other tests of the emission-data engine, whether or not they were conducted according to the test procedures of subpart F of this part. We may require you to report these additional test results. We may ask you to send other information to confirm that your tests were valid under the requirements of this part and 40 CFR part 1065.

* * * * *

(bb) * * *

(1) Describe your normal practice for importing engines. For example, this may include identifying the names and addresses of any agents you have authorized to import your engines.

* * * * *

■ 194. Section 1042.225 is amended by adding paragraphs (b)(4) and (g) to read as follows:

§ 1042.225 Amending applications for certification.

* * * * *

(b) * * *

(4) Include any other information needed to make your application correct and complete.

* * * * *

(g) You may produce engines as described in your amended application

for certification and consider those engines to be in a certified configuration if we approve a new or modified engine configuration during the model year under paragraph (d) of this section. Similarly, you may modify in-use engines as described in your amended application for certification and consider those engines to be in a certified configuration if we approve a new or modified engine configuration at any time under paragraph (d) of this section. Modifying a new or in-use engine to be in a certified configuration does not violate the tampering prohibition of 40 CFR 1068.101(b)(1), as long as this does not involve changing to a certified configuration with a higher family emission limit.

■ 195. Section 1042.235 is amended by revising paragraphs (b), (c) introductory text, (c)(4), and (d)(1) to read as follows:

§ 1042.235 Emission testing related to certification.

* * * * *

(b) Test your emission-data engines using the procedures and equipment specified in subpart F of this part. In the case of dual-fuel engines, measure emissions when operating with each type of fuel for which you intend to certify the engine. In the case of flexible-fuel engines, measure emissions when operating with the fuel mixture that best represents in-use operation or is most likely to have the highest NO_x emissions (or NO_x+HC emissions for engines subject to NO_x+HC standards), though you may ask us to instead to perform tests with both fuels separately if you can show that intermediate mixtures are not likely to occur in use.

* * * * *

(c) We may perform confirmatory testing by measuring emissions from any of your emission-data engines or other engines from the engine family, as follows:

* * * * *

(4) Before we test one of your engines, we may calibrate it within normal production tolerances for anything we do not consider an adjustable parameter. For example, this would apply for an engine parameter that is subject to production variability because it is adjustable during production, but is not considered an adjustable parameter (as defined in § 1042.901) because it is permanently sealed. For parameters that relate to a level of performance that is itself subject to a specified range (such as maximum power output), we will generally perform any calibration under this paragraph (c)(4) in a way that keeps performance within the specified range.

(d) * * *

(1) The engine family from the previous model year differs from the current engine family only with respect to model year, items identified in § 1042.225(a), or other characteristics unrelated to emissions. We may waive this criterion for differences we determine not to be relevant.

* * * * *

■ 196. Section 1042.240 is amended by revising paragraph (c)(3), adding paragraphs (c)(4) and (5), and revising paragraph (d) to read as follows:

§ 1042.240 Demonstrating compliance with exhaust emission standards.

* * * * *

(c) * * *

(3) *Sawtooth and other nonlinear deterioration patterns.* The deterioration factors described in paragraphs (c)(1) and (2) of this section assume that the highest useful life emissions occur either at the end of useful life or at the low-hour test point. The provisions of this paragraph (c)(3) apply where good engineering judgment indicates that the highest emissions over the useful life will occur between these two points. For example, emissions may increase with service accumulation until a certain maintenance step is performed, then return to the low-hour emission levels and begin increasing again. Base deterioration factors for engines with such emission patterns on the difference between (or ratio of) the point at which the highest emissions occur and the low-hour test point. Note that this applies for maintenance-related deterioration only where we allow such critical emission-related maintenance.

(4) *Deterioration factor for crankcase emissions.* If your engine vents crankcase emissions to the exhaust or to the atmosphere, you must account for crankcase emission deterioration, using good engineering judgment. You may use separate deterioration factors for crankcase emissions of each pollutant (either multiplicative or additive) or include the effects in combined deterioration factors that include exhaust and crankcase emissions together for each pollutant.

(5) *Dual-fuel and flexible-fuel engines.* In the case of dual-fuel and flexible-fuel engines, apply deterioration factors separately for each fuel type. You may accumulate service hours on a single emission-data engine using the type of fuel or the fuel mixture expected to have the highest combustion and exhaust temperatures; you may ask us to approve a different fuel mixture if you demonstrate that a different criterion is more appropriate.

(d) Determine the official emission result for each pollutant to at least one

more decimal place than the applicable standard. Apply the deterioration factor to the official emission result, as described in paragraph (c) of this section, then round the adjusted figure to the same number of decimal places as the emission standard. Compare the rounded emission levels to the emission standard for each emission-data engine. In the case of NO_x+HC standards, apply the deterioration factor to each pollutant and then add the results before rounding.

* * * * *

■ 197. Section 1042.250 is amended by revising paragraphs (b)(3)(iv) and (c) to read as follows:

§ 1042.250 Recordkeeping and reporting.

* * * * *

(b) * * *

(3) * * *

(iv) All your emission tests, including the date and purpose of each test and documentation of test parameters as specified in part 40 CFR part 1065.

* * * * *

(c) Keep required data from emission tests and all other information specified in this section for eight years after we issue your certificate. If you use the same emission data or other information for a later model year, the eight-year period restarts with each year that you continue to rely on the information.

* * * * *

■ 198. Section 1042.255 is amended by revising paragraphs (c)(2), (d), and (e) to read as follows:

§ 1042.255 EPA decisions.

* * * * *

(c) * * *

(2) Submit false or incomplete information (paragraph (e) of this section applies if this is fraudulent). This includes doing anything after submission of your application to render any of the submitted information false or incomplete.

* * * * *

(d) We may void the certificate of conformity for an engine family if you fail to keep records, send reports, or give us information as required under this part or the Clean Air Act. Note that these are also violations of 40 CFR 1068.101(a)(2).

(e) We may void your certificate if we find that you intentionally submitted false or incomplete information. This includes rendering submitted information false or incomplete after submission.

* * * * *

Subpart D—Testing Production-Line Engines

■ 199. Section 1042.301 is amended by revising paragraph (a) introductory text to read as follows:

§ 1042.301 General provisions.

(a) If you produce freshly manufactured marine engines that are subject to the requirements of this part, you must test them as described in this subpart, except as follows:

* * * * *

■ 200. Section 1042.302 is amended by revising paragraph (a) to read as follows:

§ 1042.302 Applicability of this subpart for Category 3 engines.

* * * * *

(a) You must test each Category 3 engine at the sea trial of the vessel in which it is installed or within the first 300 hours of operation, whichever occurs first. This may involve testing a fully assembled production engine before it is installed in the vessel. Since you must test each engine, the provisions of §§ 1042.310 and 1042.315(b) do not apply for Category 3 engines. If we determine that an engine failure under this subpart is caused by defective components or design deficiencies, we may revoke or suspend your certificate for the engine family as described in § 1042.340. If we determine that an engine failure under this subpart is caused only by incorrect assembly, we may suspend your certificate for the engine family as described in § 1042.325. If the engine fails, you may continue operating only to complete the sea trial and return to port. It is a violation of 40 CFR 1068.101(b)(1) to operate the vessel further until you remedy the cause of failure. Each two-hour period of such operation constitutes a separate offense. A violation lasting less than two hours constitutes a single offense.

* * * * *

Subpart F—Test Procedures

■ 201. Section 1042.501 is amended by revising paragraphs (a), (d), (e), and (f) and adding paragraph (h) to read as follows:

§ 1042.501 How do I run a valid emission test?

* * * * *

(a) Use the equipment and procedures for compression-ignition engines in 40 CFR part 1065 to determine whether engines meet the duty-cycle emission standards in §§ 1042.101 or 1042.104. Measure the emissions of all regulated pollutants as specified in 40 CFR part

1065. Use the applicable duty cycles specified in § 1042.505. The following exceptions from the 40 CFR part 1065 procedures apply:

(1) If you perform discrete-mode testing and use only one batch fuel measurement to determine your mean raw exhaust flow rate, you must target a constant sample flow rate over the mode. Verify proportional sampling as described in 40 CFR 1065.545 using the mean raw exhaust molar flow rate paired with each recorded sample flow rate.

(2) If you perform discrete-mode testing, you may verify proportional sampling over the whole duty cycle instead of verifying proportional sampling for each discrete mode.

* * * * *

(d) Adjust measured emissions to account for aftertreatment technology with infrequent regeneration as described in § 1042.525.

(e) Duty-cycle testing is limited to atmospheric pressures between 91.000 and 103.325 kPa.

(f) You may use special or alternate procedures to the extent we allow them under 40 CFR 1065.10.

* * * * *

(h) This subpart is addressed to you as a manufacturer, but it applies equally to anyone who does testing for you, and to us when we perform testing to determine if your engines meet emission standards.

■ 202. Section 1042.505 is amended by revising paragraph (b)(5)(iii) to read as follows:

§ 1042.505 Testing engines using discrete-mode or ramped-modal duty cycles.

* * * * *

(b) * * *

(5) * * *

(iii) Use the 8-mode duty cycle or the corresponding ramped-modal cycle described in 40 CFR part 1039, Appendix II, paragraph (c) for variable-speed auxiliary engines with maximum engine power at or above 19 kW that are not propeller-law engines.

* * * * *

■ 203. Section 1042.515 is amended by revising paragraphs (f)(2), (f)(4), and (g) to read as follows:

§ 1042.515 Test procedures related to not-to-exceed standards.

* * * * *

(f) * * *

(2) You may ask us to approve a Limited Testing Region (LTR). An LTR is a region of engine operation, within the applicable NTE zone, where you have demonstrated that your engine family operates for no more than 5.0

percent of its normal in-use operation, on a time-weighted basis. You must specify an LTR using boundaries based on engine speed and power (or torque), where the LTR boundaries must coincide with some portion of the boundary defining the overall NTE zone. Any emission data collected within an LTR for a time duration that exceeds 5.0 percent of the duration of its respective NTE sampling period will be excluded when determining compliance with the applicable NTE standards. Any emission data collected within an LTR for a time duration of 5.0 percent or less of the duration of the respective NTE sampling period will be included when determining compliance with the NTE standards.

* * * * *

(4) You may exclude emission data based on catalytic aftertreatment temperatures as follows:

(i) For an engine equipped with a catalytic NO_x aftertreatment system, exclude NO_x emission data that is collected when the exhaust temperature at any time during the NTE event is less than 250 °C.

(ii) For an engine equipped with an oxidizing catalytic aftertreatment system, exclude HC and CO emission data that is collected when the exhaust temperature at any time during the NTE event is less than 250 °C. Similarly, exclude PM emission data during operation involving exhaust temperature below 250 °C for an engine equipped with an oxidizing flow-through catalyst.

(iii) Measure exhaust temperature within 30 cm downstream of the last applicable catalytic aftertreatment device. Where there are parallel paths, use good engineering judgment to measure the temperature within 30 cm downstream of the last applicable catalytic aftertreatment device in the path with the greatest exhaust flow.

(g) Emission sampling is not valid for NTE testing if it includes any active regeneration, unless the emission averaging period includes the complete regeneration event(s) and the full period of engine operation until the start of the next regeneration event. This provision applies only for engines that send an electronic signal indicating the start of the regeneration event.

■ 204. Section 1042.525 is revised to read as follows:

§ 1042.525 How do I adjust emission levels to account for infrequently regenerating aftertreatment devices?

For engines using aftertreatment technology with infrequent regeneration events that may occur during testing, take one of the following approaches to

account for the emission impact of regeneration, or use an alternate methodology that we approve for Category 3 engines:

(a) You may use the calculation methodology described in 40 CFR 1065.680 to adjust measured emission results. Do this by developing an upward adjustment factor and a downward adjustment factor for each pollutant based on measured emission data and observed regeneration frequency as follows:

(1) Adjustment factors should generally apply to an entire engine family, but you may develop separate adjustment factors for different configurations within an engine family. Use the adjustment factors from this section in all testing for the engine family.

(2) You may use carryover or carry-across data to establish adjustment factors for an engine family as described in § 1042.235, consistent with good engineering judgment.

(3) Determine the frequency of regeneration, *F*, as described in 40 CFR 1065.680 from in-use operating data or from running repetitive tests in a laboratory. If the engine is designed for regeneration at fixed time intervals, you may apply good engineering judgment to determine *F* based on those design parameters.

(4) Identify the value of *F* in each application for certification for which it applies.

(b) You may ask us to approve an alternate methodology to account for regeneration events. We will generally limit approval to cases where your engines use aftertreatment technology with extremely infrequent regeneration and you are unable to apply the provisions of this section.

(c) You may choose to make no adjustments to measured emission results if you determine that regeneration does not significantly affect emission levels for an engine family (or configuration) or if it is not practical to identify when regeneration occurs. If you choose not to make adjustments under paragraph (a) or (b) of this section, your engines must meet emission standards for all testing, without regard to regeneration.

Subpart G—Special Compliance Provisions

■ 205. Section 1042.601 is amended by revising paragraph (d) and adding paragraph (j) to read as follows:

§ 1042.601 General compliance provisions for marine engines and vessels.

* * * * *

(d) The provisions of § 1042.635 for the national security exemption apply in addition to the provisions of 40 CFR 1068.225.

* * * * *

(j) Subpart C of this part describes how to test and certify dual-fuel and flexible-fuel engines. Some multi-fuel engines may not fit either of those defined terms. For such engines, we will determine whether it is most appropriate to treat them as single-fuel engines, dual-fuel engines, or flexible-fuel engines based on the range of possible and expected fuel mixtures. For example, an engine might burn natural gas but initiate combustion with a pilot injection of diesel fuel. If the engine is designed to operate with a single fueling algorithm (*i.e.*, fueling rates are fixed at a given engine speed and load condition), we would generally treat it as a single-fuel engine. In this context, the combination of diesel fuel and natural gas would be its own fuel type. If the engine is designed to also operate on diesel fuel alone, we would generally treat it as a dual-fuel engine. If the engine is designed to operate on varying mixtures of the two fuels, we would generally treat it as a flexible-fuel engine. To the extent that requirements vary for the different fuels or fuel mixtures, we may apply the more stringent requirements.

■ 206. Section 1042.605 is amended by revising paragraph (e)(3) to read as follows:

§ 1042.605 Dressing engines already certified to other standards for nonroad or heavy-duty highway engines for marine use.

* * * * *

(e) * * *

(3) Send the Designated Compliance Officer written notification describing your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated Compliance Officer a signed letter with all the following information:

(i) Identify your full corporate name, address, and telephone number.

(ii) List the engine models for which you used this exemption in the previous year and describe your basis for meeting the sales restrictions of paragraph (d)(4) of this section.

(iii) State: “We prepared each listed engine model for marine application without making any changes that could increase its certified emission levels, as described in 40 CFR 1042.605.”

* * * * *

■ 207. Section 1042.610 is amended by revising paragraph (e)(2) to read as follows:

§ 1042.610 Certifying auxiliary marine engines to land-based standards.

* * * *

(e) * * *

(2) Send the Designated Compliance Officer written notification describing your plans before using the provisions of this section. In addition, by February 28 of each calendar year (or less often if we tell you), send the Designated Compliance Officer a signed letter with all the following information:

(i) Identify your full corporate name, address, and telephone number.

(ii) List the engine models for which you used this exemption in the previous year and describe your basis for meeting the sales restrictions of paragraph (d)(3) of this section.

(iii) State: "We prepared each listed engine model for marine application without making any changes that could increase its certified emission levels, as described in 40 CFR 1042.610."

* * * *

■ 208. Section 1042.630 is amended by revising paragraph (f) to read as follows:

§ 1042.630 Personal-use exemption.

* * * *

(f) The vessel must be a vessel that is not classed or subject to Coast Guard inspections or surveys. Note that dockside examinations performed by the Coast Guard are not considered inspections (see 46 U.S.C. 3301 and 46 U.S.C. 4502).

■ 209. Section 1042.635 is revised to read as follows:

§ 1042.635 National security exemption.

Engines qualify for a national security exemption as described in 40 CFR 1068.225. This applies to both freshly manufactured and remanufactured engines.

§ 1042.640 [Removed]

■ 210. Section 1042.640 is removed.

■ 211. Section 1042.650 is amended by revising paragraphs (a) and (d) to read as follows:

§ 1042.650 Exemptions for migratory vessels and auxiliary engines on Category 3 vessels.

* * * *

(a) *Temporary exemption.* A vessel owner may ask us for a temporary exemption from the tampering prohibition in 40 CFR 1068.101(b)(1) for a vessel if it will operate for an extended period outside the United States where ULSD is not available. In your request, describe where the vessel will operate, how long it will operate there, why ULSD will be unavailable, and how you will modify the engine, including its emission controls. If we approve your

request, you may modify the engine, but only as needed to disable or remove the emission controls needed for meeting the Tier 4 standards. You must return the engine to its original certified configuration before the vessel returns to the United States to avoid violating the tampering prohibition in 40 CFR 1068.101(b)(1). We may set additional conditions to prevent circumvention of the provisions of this part.

* * * *

(d) *Auxiliary engines on Category 3 vessels.* Auxiliary engines that will be installed on vessels with Category 3 propulsion engines qualify for an exemption from the standards of this part provided all the following conditions are met:

(1) To be eligible for this exemption, the engine must meet all the following criteria.

(i) The engine must have an EIAPP certificate demonstrating compliance with the applicable NO_x standards of Annex VI and meet all other applicable requirements of 40 CFR part 1043.

Engines installed on vessels constructed on or after January 1, 2016 must conform fully to the Annex VI Tier III NO_x standards as described in 40 CFR part 1043 and meet all other applicable requirements in 40 CFR part 1043. Engines that would otherwise be subject to the Tier 4 standards of this part must also conform fully to the Annex VI Tier III NO_x standards as described in 40 CFR part 1043.

(ii) The engine may not be used for propulsion (except for emergency engines).

(iii) Engines certified to the Annex VI Tier III standards may be equipped with on-off NO_x controls, as long as they conform to the requirements of §§ 1042.110(d) and 1042.115(g); however, the engines must comply fully with the Annex VI Tier II standards when the emission controls are disabled, and meet any other requirements that apply under Annex VI.

(2) You must notify the Designated Compliance Officer of your intent to use this exemption before you introduce engines into U.S. commerce, not later than the time that you apply for an EIAPP certificate for the engine under 40 CFR part 1043.

(3) The remanufactured engine requirements of subpart I of this part do not apply.

(4) If you introduce an engine into U.S. commerce under this paragraph (d), you must meet the labeling requirements in § 1042.135, but add the following statement instead of the compliance statement in § 1042.135(c)(10):

THIS ENGINE DOES NOT COMPLY WITH CURRENT U.S. EPA EMISSION STANDARDS UNDER 40 CFR 1042.650 AND IS FOR USE SOLELY IN VESSELS WITH CATEGORY 3 PROPULSION ENGINES. INSTALLATION OR USE OF THIS ENGINE IN ANY OTHER APPLICATION MAY BE A VIOLATION OF FEDERAL LAW SUBJECT TO CIVIL PENALTY.

(5) The reporting requirements of § 1042.660 apply for engines exempted under this paragraph (d).

■ 212. Section 1042.655 is amended by revising the section heading and paragraph (b) to read as follows:

§ 1042.655 Special certification provisions for Category 3 engines with aftertreatment.

* * * *

(b) *Required testing.* The emission-data engine must be tested as specified in subpart F of this part to verify that the engine-out emissions comply with the Tier 2 standards. The catalyst material or other aftertreatment device must be tested under conditions that accurately represent actual engine conditions for the test points. This catalyst or aftertreatment testing may be performed on a bench scale.

* * * *

■ 213. Section 1042.660 is amended by revising paragraphs (b) and (c)(1) to read as follows:

§ 1042.660 Requirements for vessel manufacturers, owners, and operators.

* * * *

(b) For vessels equipped with SCR systems requiring the use of urea or other reductants, owners and operators must report to the Designated Enforcement Officer within 30 days any operation of such vessels without the appropriate reductant. This includes vessels with auxiliary engines certified to Annex VI standards under § 1042.650(d). Failure to comply with the requirements of this paragraph is a violation of 40 CFR 1068.101(a)(2). Note that such operation is a violation of 40 CFR 1068.101(b)(1).

(c) * * *

(1) The requirements of this paragraph (c)(1) apply only for Category 3 engines. All maintenance, repair, adjustment, and alteration of Category 3 engines subject to the provisions of this part performed by any owner, operator or other maintenance provider must be performed using good engineering judgment, in such a manner that the engine continues (after the maintenance, repair, adjustment or alteration) to meet the emission standards it was certified as meeting prior to the need for service. This includes but is not limited to complying with the maintenance

instructions described in § 1042.125. Adjustments are limited to the range specified by the engine manufacturer in the approved application for certification. Note that where a repair (or other maintenance) cannot be completed while at sea, it is not a violation to continue operating the engine to reach your destination.

* * * * *

■ 214. Section 1042.670 is amended by revising paragraph (d) to read as follows:

§ 1042.670 Special provisions for gas turbine engines.

* * * * *

(d) *Equivalent displacement.* Apply displacement-based provisions of this part by calculating an equivalent displacement from maximum engine power. The equivalent per-cylinder displacement (in liters) equals maximum engine power in kW multiplied by 0.00311, except that all gas turbines with maximum engine power above 9,300 kW are considered to have an equivalent per-cylinder displacement of 29.0 liters. Also, determine the appropriate Tier 3 standards for Category 1 engines based on the engine having an equivalent power density below 35 kW per liter.

* * * * *

Subpart H—Averaging, Banking, and Trading for Certification

■ 215. Section 1042.701 is amended by adding paragraphs (j) and (k) to read as follows:

§ 1042.701 General provisions.

* * * * *

(j) NO_x+HC and PM credits generated under 40 CFR part 94 may be used under this part in the same manner as NO_x+HC and PM credits generated under this part.

(k) You may use either of the following approaches to retire or forego emission credits:

(1) You may retire emission credits generated from any number of your engines. This may be considered donating emission credits to the environment. Identify any such credits in the reports described in § 1042.730. Engines must comply with the applicable FELs even if you donate or sell the corresponding emission credits under this paragraph (k). Those credits may no longer be used by anyone to demonstrate compliance with any EPA emission standards.

(2) You may certify a family using an FEL below the emission standard as described in this part and choose not to generate emission credits for that

family. If you do this, you do not need to calculate emission credits for those families and you do not need to submit or keep the associated records described in this subpart for that family.

■ 216. Section 1042.705 is amended by revising paragraph (c) to read as follows:

§ 1042.705 Generating and calculating emission credits.

* * * * *

(c) As described in § 1042.730, compliance with the requirements of this subpart is determined at the end of the model year based on actual U.S.-directed production volumes. Do not include any of the following engines to calculate emission credits:

(1) Engines with a permanent exemption under subpart G of this part or under 40 CFR part 1068.

(2) Exported engines.

(3) Engines not subject to the requirements of this part, such as those excluded under § 1042.5.

(4) [Reserved]

(5) Any other engines, where we indicate elsewhere in this part 1042 that they are not to be included in the calculations of this subpart.

■ 217. Section 1042.710 is amended by revising paragraph (c) to read as follows:

§ 1042.710 Averaging emission credits.

* * * * *

(c) If you certify an engine family to an FEL that exceeds the otherwise applicable emission standard, you must obtain enough emission credits to offset the engine family's deficit by the due date for the final report required in § 1042.730. The emission credits used to address the deficit may come from your other engine families that generate emission credits in the same model year, from emission credits you have banked from previous model years, or from emission credits generated in the same or previous model years that you obtained through trading.

■ 218. Section 1042.725 is amended by revising paragraph (b)(2) to read as follows:

§ 1042.725 Information required for the application for certification.

* * * * *

(b) * * *

(2) Detailed calculations of projected emission credits (positive or negative) based on projected production volumes. We may require you to include similar calculations from your other engine families to demonstrate that you will be able to avoid negative credit balances for the model year. If you project negative emission credits for a family, state the source of positive emission

credits you expect to use to offset the negative emission credits.

■ 219. Section 1042.730 is amended by revising paragraphs (b), (c)(2), and (d) to read as follows:

§ 1042.730 ABT reports.

* * * * *

(b) Your end-of-year and final reports must include the following information for each engine family participating in the ABT program:

(1) Engine-family designation and averaging set.

(2) The emission standards that would otherwise apply to the engine family.

(3) The FEL for each pollutant. If you change the FEL after the start of production, identify the date that you started using the new FEL and/or give the engine identification number for the first engine covered by the new FEL. In this case, identify each applicable FEL and calculate the positive or negative emission credits as specified in § 1042.225.

(4) The projected and actual U.S.-directed production volumes for the model year, as described in § 1042.705(c). If you changed an FEL during the model year, identify the actual U.S.-directed production volume associated with each FEL.

(5) Maximum engine power for each engine configuration, and the average engine power weighted by U.S.-directed production volumes for the engine family.

(6) Useful life.

(7) Calculated positive or negative emission credits for the whole engine family. Identify any emission credits that you traded, as described in paragraph (d)(1) of this section.

(c) * * *

(2) State whether you will retain any emission credits for banking. If you choose to retire emission credits that would otherwise be eligible for banking, identify the engine families that generated the emission credits, including the number of emission credits from each family.

* * * * *

(d) If you trade emission credits, you must send us a report within 90 days after the transaction, as follows:

(1) As the seller, you must include the following information in your report:

(i) The corporate names of the buyer and any brokers.

(ii) A copy of any contracts related to the trade.

(iii) The averaging set corresponding to the engine families that generated emission credits for the trade, including the number of emission credits from each averaging set.

(2) As the buyer, you must include the following information in your report:

(i) The corporate names of the seller and any brokers.

(ii) A copy of any contracts related to the trade.

(iii) How you intend to use the emission credits, including the number of emission credits you intend to apply for each averaging set.

* * * * *

■ 220. Section 1042.735 is amended by revising paragraphs (a) and (b) to read as follows:

§ 1042.735 Recordkeeping.

(a) You must organize and maintain your records as described in this section.

(b) Keep the records required by this section for at least eight years after the due date for the end-of-year report. You may not use emission credits for any engines if you do not keep all the records required under this section. You must therefore keep these records to continue to bank valid credits.

* * * * *

Subpart I—Special Provisions for Remanufactured Marine Engines

■ 221. Section 1042.810 is amended by revising paragraph (c) to read as follows:

§ 1042.810 Requirements for owner/operators and installers during remanufacture.

* * * * *

(c) Your engine is not subject to the standards of this subpart if we determine that no certified remanufacturing system is available for your engine as described in § 1042.815. For engines that are remanufactured during multiple events within a five-year period, you are not required to use a certified system until all of your engine's cylinders have been replaced after the system became available. For example, if you remanufacture your 16-cylinder engine by replacing four cylinders each January and a system becomes available for your engine June 1, 2010, your engine must be in a certified configuration when you replace four cylinders in January of 2014. At that point, all 16 cylinders would have been replaced after June 1, 2010.

* * * * *

■ 222. Section 1042.830 is revised to read as follows:

§ 1042.830 Labeling.

(a) The labeling requirements of this paragraph (a) apply for remanufacturing that is subject to the standards of this subpart. At the time of remanufacture,

affix a permanent and legible label identifying each engine. The label must be—

(1) Attached in one piece so it is not removable without being destroyed or defaced.

(2) Secured to a part of the engine needed for normal operation and not normally requiring replacement.

(3) Durable and readable for the engine's entire useful life.

(4) Written in English.

(b) The label required under paragraph (a) of this section must—

(1) Include the heading "EMISSION CONTROL INFORMATION".

(2) Include your full corporate name and trademark.

(3) Include EPA's standardized designation for the engine family.

(4) State the engine's category, displacement (in liters or L/cyl), maximum engine power (in kW), and power density (in kW/L) as needed to determine the emission standards for the engine family. You may specify displacement, maximum engine power, and power density as ranges consistent with the ranges listed in § 1042.101. See § 1042.140 for descriptions of how to specify per-cylinder displacement, maximum engine power, and power density.

(5) State: "THIS MARINE ENGINE MEETS THE STANDARDS OF 40 CFR PART 1042, SUBPART I, FOR [CALENDAR YEAR OF REMANUFACTURE]."

(c) For remanufactured engines that are subject to this subpart as described in § 1042.801(a), but are not subject to remanufacturing standards as allowed by § 1042.810 or § 1042.815, you may voluntarily add a label as specified in paragraphs (a) and (b) of this section, except that the label must omit the standardized designation for the engine family and include the following alternative compliance statement: "THIS MARINE ENGINE IS NOT SUBJECT TO REMANUFACTURING STANDARDS UNDER 40 CFR PART 1042, SUBPART I, FOR [CALENDAR YEAR OF REMANUFACTURE]."

(d) You may add information to the emission control information label to identify other emission standards that the engine meets or does not meet (such as international standards). You may also add other information to ensure that the engine will be properly maintained and used.

(e) You may ask us to approve modified labeling requirements in this section if you show that it is necessary or appropriate. We will approve your request if your alternate label is consistent with the intent of the labeling requirements of this section.

■ 223. Section 1042.836 is amended by revising paragraph (c)(1) to read as follows:

§ 1042.836 Marine certification of locomotive remanufacturing systems.

* * * * *

(c) * * *

(1) Tier 0 locomotive systems may not be used for any Category 1 engines or Tier 1 or later Category 2 engines.

* * * * *

■ 224. Section 1042.840 is amended by revising paragraphs (c) and (o) to read as follows:

§ 1042.840 Application requirements for remanufactured engines.

* * * * *

(c) Summarize the cost effectiveness analysis used to demonstrate your system will meet the availability criteria of § 1042.815. Identify the maximum allowable costs for vessel modifications to meet these criteria.

* * * * *

(o) Report all valid test results. Also indicate whether there are test results from invalid tests or from any other tests of the emission-data engine, whether or not they were conducted according to the test procedures of subpart F of this part. If you measure CO₂, report those emission levels. We may require you to report these additional test results. We may ask you to send other information to confirm that your tests were valid under the requirements of this part and 40 CFR part 1065.

* * * * *

■ 225. Section 1042.850 is amended by revising the introductory text to read as follows:

§ 1042.850 Exemptions and hardship relief.

This section describes exemption and hardship provisions that are available for owner/operators of engines subject to the provisions of this subpart.

* * * * *

Subpart J—Definitions and Other Reference Information

■ 226. Section 1042.901 is amended as follows:

■ a. By revising the definition of "Designated Compliance Officer".

■ b. By adding definitions for "Designated Enforcement Officer", "Dual-fuel", and "Flexible-fuel" in alphabetical order.

■ c. By revising the definitions for "Low-sulfur diesel fuel", "Model year", and "Placed into service".

■ d. By removing the definition for "Point of first retail sale".

■ e. By revising the definition of “Sulfur-sensitive technology”.

The revisions and additions read as follows:

§ 1042.901 Definitions.

* * * * *

Designated Compliance Officer means the Director, Diesel Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; *complianceinfo@epa.gov*; *epa.gov/otaq/verify*.

Designated Enforcement Officer means the Director, Air Enforcement Division (2242A), U.S. Environmental Protection Agency, 1200 Pennsylvania Ave. NW., Washington, DC 20460.

* * * * *

Dual-fuel means relating to an engine designed for operation on two different fuels but not on a continuous mixture of those fuels (see § 1042.601(j)). For purposes of this part, such an engine remains a dual-fuel engine even if it is designed for operation on three or more different fuels. Note that this definition differs from MARPOL Annex VI.

* * * * *

Flexible-fuel means relating to an engine designed for operation on any mixture of two or more different fuels (see § 1042.601(j)).

* * * * *

Low-sulfur diesel fuel means one of the following:

(1) For in-use fuels, *low-sulfur diesel fuel* means a diesel fuel marketed as low-sulfur diesel fuel having a maximum sulfur concentration of 500 parts per million.

(2) For testing, *low-sulfur diesel fuel* has the meaning given in 40 CFR part 1065.

* * * * *

Model year means any of the following:

(1) For freshly manufactured marine engines (see definition of “new marine engine,” paragraph (1)), model year means one of the following:

(i) Calendar year of production.

(ii) Your annual new model production period if it is different than the calendar year. This must include January 1 of the calendar year for which the model year is named. It may not begin before January 2 of the previous calendar year and it must end by December 31 of the named calendar year. For seasonal production periods not including January 1, model year means the calendar year in which the production occurs, unless you choose to certify the applicable engine family with the following model year. For example, if your production period is June 1, 2010 through November 30, 2010, your

model year would be 2010 unless you choose to certify the engine family for model year 2011.

(2) For an engine that is converted to a marine engine after being certified and placed into service as a motor vehicle engine, a nonroad engine that is not a marine engine, or a stationary engine, model year means the calendar year in which the engine was originally produced. For an engine that is converted to a marine engine after being placed into service as a motor vehicle engine, a nonroad engine that is not a marine engine, or a stationary engine without having been certified, model year means the calendar year in which the engine becomes a new marine engine. (See definition of “new marine engine,” paragraph (2)).

(3) For an uncertified marine engine excluded under § 1042.5 that is later subject to this part 1042 as a result of being installed in a different vessel, model year means the calendar year in which the engine was installed in the non-excluded vessel. For a marine engine excluded under § 1042.5 that is later subject to this part 1042 as a result of reflagging the vessel, model year means the calendar year in which the engine was originally manufactured. For a marine engine that become new under paragraph (7) of the definition of “new marine engine,” model year means the calendar year in which the engine was originally manufactured. (See definition of “new marine engine,” paragraphs (3) and (7).)

(4) For engines that do not meet the definition of “freshly manufactured” but are installed in new vessels, model year means the calendar year in which the engine is installed in the new vessel (see definition of “new marine engine,” paragraph (4)).

(5) For remanufactured engines, model year means the calendar year in which the remanufacture takes place.

(6) For imported engines:

(i) For imported engines described in paragraph (6)(i) of the definition of “new marine engine,” *model year* has the meaning given in paragraphs (1) through (4) of this definition.

(ii) For imported engines described in paragraph (6)(ii) of the definition of “new marine engine,” *model year* means the calendar year in which the engine is remanufactured.

(iii) For imported engines described in paragraph (6)(iii) of the definition of “new marine engine,” *model year* means the calendar year in which the engine is first assembled in its imported configuration, unless specified otherwise in this part or in 40 CFR part 1068.

(iv) For imported engines described in paragraph (6)(iv) of the definition of “new marine engine,” *model year* means the calendar year in which the engine is imported.

(7) [Reserved]

(8) For freshly manufactured vessels, model year means the calendar year in which the keel is laid or the vessel is at a similar stage of construction. For vessels that become new under paragraph (2) or (3) of the definition of “new vessel” (as a result of modifications), model year means the calendar year in which the modifications physically begin.

* * * * *

Placed into service means put into initial use for its intended purpose. Engines and vessels do not qualify as being “placed into service” based on incidental use by a manufacturer or dealer.

* * * * *

Sulfur-sensitive technology means an emission control technology that experiences a significant drop in emission control performance or emission-system durability when an engine is operated on low-sulfur diesel fuel (*i.e.*, fuel with a sulfur concentration of 300 to 500 ppm) as compared to when it is operated on ultra-low sulfur diesel fuel (*i.e.*, fuel with a sulfur concentration less than 15 ppm). Exhaust gas recirculation is not a sulfur-sensitive technology.

* * * * *

■ 227. Section 1042.905 is revised to read as follows:

§ 1042.905 Symbols, acronyms, and abbreviations.

The following symbols, acronyms, and abbreviations apply to this part:

ABT Averaging, banking, and trading.
 AECD auxiliary emission control device.
 CFR Code of Federal Regulations.
 CH₄ methane.
 CO carbon monoxide.
 CO₂ carbon dioxide.
 cyl cylinder.
 disp. displacement.
 ECA Emission Control Area.
 EEZ Exclusive Economic Zone.
 EPA Environmental Protection Agency.
 FEL Family Emission Limit.
 g grams.
 HC hydrocarbon.
 hr hours.
 IMO International Maritime Organization.
 kPa kilopascals.
 kW kilowatts.
 L liters.
 LTR Limited Testing Region.

N₂O nitrous oxide.
 NARA National Archives and Records Administration.
 NMHC nonmethane hydrocarbon.
 NO_x oxides of nitrogen (NO and NO₂).
 NTE not-to-exceed.
 PM particulate matter.
 RPM revolutions per minute.
 SAE Society of Automotive Engineers.
 SCR selective catalytic reduction.
 THC total hydrocarbon.
 THCE total hydrocarbon equivalent.
 ULSD ultra low-sulfur diesel fuel.
 U.S.C. United States Code.

■ 228. Section 1042.910 is revised to read as follows:

§ 1042.910 Incorporation by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the Environmental Protection Agency must publish a document in the **Federal Register** and the material must be available to the public. All approved material is available for inspection at U.S. EPA, Air and Radiation Docket and Information Center, 1301 Constitution Ave. NW., Room B102, EPA West Building, Washington, DC 20460, (202) 202-1744, and is available from the sources listed below. It is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202-741-6030, or go to: <http://www.archives.gov/federal-register/code-of-federal-regulations/ibr-locations.html>.

(b) The International Maritime Organization, 4 Albert Embankment, London SE1 7SR, United Kingdom, or www.imo.org, or 44-(0)20-7735-7611.

(1) MARPOL Annex VI, Regulations for the Prevention of Air Pollution from Ships, Third Edition, 2013, and NO_x Technical Code 2008.

(i) Revised MARPOL Annex VI, Regulations for the Prevention of Pollution from Ships, Third Edition, 2013 ("2008 Annex VI"); IBR approved for § 1042.901.

(ii) NO_x Technical Code 2008, Technical Code on Control of Emission of Nitrogen Oxides from Marine Diesel Engines, 2013 Edition, ("NO_x Technical Code"); IBR approved for §§ 1042.104(g), 1042.230(d), 1042.302(c) and (e), 1042.501(g), and 1042.901.

(iii) Annex 12, Resolution MEPC.251(66) from the Report of the Marine Environment Protection Committee on its Sixty-Sixth Session, April 25, 2014. This document describes new and revised provisions that are

considered to be part of Annex VI and NO_x Technical Code 2008 as referenced in paragraphs (b)(1)(i) and (ii) of this section. IBR approved for §§ 1042.104(g), 1042.230(d), 1042.302(c) and (e), 1042.501(g), and 1042.901.

(2) [Reserved]

■ 229. Section 1042.915 is revised to read as follows:

§ 1042.915 Confidential information.

The provisions of 40 CFR 1068.10 apply for information you consider confidential.

■ 230. Section 1042.925 is revised to read as follows:

§ 1042.925 Reporting and recordkeeping requirements.

(a) This part includes various requirements to submit and record data or other information. Unless we specify otherwise, store required records in any format and on any media and keep them readily available for eight years after you send an associated application for certification, or eight years after you generate the data if they do not support an application for certification. You are expected to keep your own copy of required records rather than relying on someone else to keep records on your behalf. We may review these records at any time. You must promptly send us organized, written records in English if we ask for them. We may require you to submit written records in an electronic format.

(b) The regulations in § 1042.255, 40 CFR 1068.25, and 40 CFR 1068.101 describe your obligation to report truthful and complete information. This includes information not related to certification. Failing to properly report information and keep the records we specify violates 40 CFR 1068.101(a)(2), which may involve civil or criminal penalties.

(c) Send all reports and requests for approval to the Designated Compliance Officer (see § 1042.801).

(d) Any written information we require you to send to or receive from another company is deemed to be a required record under this section. Such records are also deemed to be submissions to EPA. We may require you to send us these records whether or not you are a certificate holder.

(e) Under the Paperwork Reduction Act (44 U.S.C. 3501 et seq), the Office of Management and Budget approves the reporting and recordkeeping specified in the applicable regulations. The following items illustrate the kind of reporting and recordkeeping we require for engines and vessels regulated under this part:

(1) We specify the following requirements related to engine certification in this part 1042:

(i) In § 1042.135 we require engine manufacturers to keep certain records related to duplicate labels sent to vessel manufacturers.

(ii) In § 1042.145 we include various reporting and recordkeeping requirements related to interim provisions.

(iii) In subpart C of this part we identify a wide range of information required to certify engines.

(iv) In §§ 1042.345 and 1042.350 we specify certain records related to production-line testing.

(v) In subpart G of this part we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various special compliance provisions.

(vi) In §§ 1042.725, 1042.730, and 1042.735 we specify certain records related to averaging, banking, and trading.

(vii) In subpart I of this part we specify certain records related to meeting requirements for remanufactured engines.

(2) We specify the following requirements related to testing in 40 CFR part 1065:

(i) In 40 CFR 1065.2 we give an overview of principles for reporting information.

(ii) In 40 CFR 1065.10 and 1065.12 we specify information needs for establishing various changes to published test procedures.

(iii) In 40 CFR 1065.25 we establish basic guidelines for storing test information.

(iv) In 40 CFR 1065.695 we identify the specific information and data items to record when measuring emissions.

(3) We specify the following requirements related to the general compliance provisions in 40 CFR part 1068:

(i) In 40 CFR 1068.5 we establish a process for evaluating good engineering judgment related to testing and certification.

(ii) In 40 CFR 1068.25 we describe general provisions related to sending and keeping information.

(iii) In 40 CFR 1068.27 we require manufacturers to make engines available for our testing or inspection if we make such a request.

(iv) In 40 CFR 1068.105 we require vessel manufacturers to keep certain records related to duplicate labels from engine manufacturers.

(v) In 40 CFR 1068.120 we specify recordkeeping related to rebuilding engines.

(vi) In 40 CFR part 1068, subpart C, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to various exemptions.

(vii) In 40 CFR part 1068, subpart D, we identify several reporting and recordkeeping items for making demonstrations and getting approval related to importing engines.

(viii) In 40 CFR 1068.450 and 1068.455 we specify certain records

related to testing production-line engines in a selective enforcement audit.

(ix) In 40 CFR 1068.501 we specify certain records related to investigating and reporting emission-related defects.

(x) In 40 CFR 1068.525 and 1068.530 we specify certain records related to recalling nonconforming engines.

(xi) In 40 CFR part 1068, subpart G, we specify certain records for requesting a hearing.

■ 231. Appendix II to Part 1042 is revised to read as follows:

Appendix II to Part 1042—Steady-State Duty Cycles

(a) The following duty cycles apply as specified in § 1042.505(b)(1):

(1) The following duty cycle applies for discrete-mode testing:

E3 mode No.	Engine speed ¹	Percent of maximum test power	Weighting factors
1	Maximum test speed	100	0.2
2	91%	75	0.5
3	80%	50	0.15
4	63%	25	0.15

¹ Maximum test speed is defined in 40 CFR part 1065. Percent speed values are relative to maximum test speed.

(2) The following duty cycle applies for ramped-modal testing:

RMC mode	Time in mode (seconds)	Engine speed ^{1 3}	Power (percent) ^{2 3}
1a Steady-state	229	Maximum test speed	100%.
1b Transition	20	Linear transition	Linear transition in torque.
2a Steady-state	166	63%	25%.
2b Transition	20	Linear transition	Linear transition in torque.
3a Steady-state	570	91%	75%.
3b Transition	20	Linear transition	Linear transition in torque.
4a Steady-state	175	80%	50%.

¹ Maximum test speed is defined in 40 CFR part 1065. Percent speed is relative to maximum test speed.

² The percent power is relative to the maximum test power.

³ Advance from one mode to the next within a 20 second transition phase. During the transition phase, command a linear progression from the torque setting of the current mode to the torque setting of the next mode, and simultaneously command a similar linear progression for engine speed if there is a change in speed setting.

(b) The following duty cycles apply as specified in § 1042.505(b)(2):

(1) The following duty cycle applies for discrete-mode testing:

E5 mode No.	Engine speed ¹	Percent of maximum test power	Weighting factors
1	Maximum test speed	100	0.08
2	91%	75	0.13
3	80%	50	0.17
4	63%	25	0.32
5	Warm idle	0	0.3

¹ Maximum test speed is defined in 40 CFR part 1065. Percent speed values are relative to maximum test speed.

(2) The following duty cycle applies for ramped-modal testing:

RMC mode	Time in mode (seconds)	Engine speed ^{1 3}	Power (percent) ^{2 3}
1a Steady-state	167	Warm idle	0.
1b Transition	20	Linear transition	Linear transition in torque.
2a Steady-state	85	Maximum test speed	100%.
2b Transition	20	Linear transition	Linear transition in torque.
3a Steady-state	354	63%	25%.
3b Transition	20	Linear transition	Linear transition in torque.
4a Steady-state	141	91%	75%.
4b Transition	20	Linear transition	Linear transition in torque.
5a Steady-state	182	80%	50%.

RMC mode	Time in mode (seconds)	Engine speed ^{1 3}	Power (percent) ^{2 3}
5b Transition	20	Linear transition	Linear transition in torque.
6 Steady-state	171	Warm idle	0.

¹ Maximum test speed is defined in 40 CFR part 1065. Percent speed is relative to maximum test speed.

² The percent power is relative to the maximum test power.

³ Advance from one mode to the next within a 20 second transition phase. During the transition phase, command a linear progression from the torque setting of the current mode to the torque setting of the next mode, and simultaneously command a similar linear progression for engine speed if there is a change in speed setting.

(c) The following duty cycles apply as specified in § 1042.505(b)(3):

(1) The following duty cycle applies for discrete-mode testing:

E2 mode No.	Engine speed ¹	Torque (percent) ²	Weighting factors
1	Engine Governed	100	0.2
2	Engine Governed	75	0.5
3	Engine Governed	50	0.15
4	Engine Governed	25	0.15

¹ Speed terms are defined in 40 CFR part 1065.

² The percent torque is relative to the maximum test torque as defined in 40 CFR part 1065.

(2) The following duty cycle applies for ramped-modal testing:

RMC mode	Time in mode (seconds)	Engine speed	Torque (percent) ^{1 2}
1a Steady-state	229	Engine Governed	100%.
1b Transition	20	Engine Governed	Linear transition.
2a Steady-state	166	Engine Governed	25%.
2b Transition	20	Engine Governed	Linear transition.
3a Steady-state	570	Engine Governed	75%.
3b Transition	20	Engine Governed	Linear transition.
4a Steady-state	175	Engine Governed	50%.

¹ The percent torque is relative to the maximum test torque as defined in 40 CFR part 1065.

² Advance from one mode to the next within a 20 second transition phase. During the transition phase, command a linear progression from the torque setting of the current mode to the torque setting of the next mode.

■ 232. Appendix III to Part 1042 is revised to read as follows:

Appendix III to Part 1042—Not-to-Exceed Zones

(a) The following definitions apply for this Appendix III:

(1) *Percent power* means the percentage of the maximum power achieved at Maximum Test Speed (or at Maximum Test Torque for constant-speed engines).

(2) *Percent speed* means the percentage of Maximum Test Speed.

(b) Figure 1 of this Appendix illustrates the default NTE zone for marine engines certified

using the duty cycle specified in § 1042.505(b)(1), except for variable-speed propulsion marine engines used with controllable-pitch propellers or with electrically coupled propellers, as follows:

(1) Subzone 1 is defined by the following boundaries:

(i) $\text{Percent power} \div 100 > 0.7 \cdot (\text{percent speed} \div 100)^{2.5}$.

(ii) $\text{Percent power} \div 100 \leq (\text{percent speed} \div 90)^{3.5}$.

(iii) $\text{Percent power} \div 100 \geq 3.0 \cdot (1 - \text{percent speed} \div 100)$.

(2) Subzone 2 is defined by the following boundaries:

(i) $\text{Percent power} \div 100 \geq 0.7 \cdot (\text{percent speed} \div 100)^{2.5}$.

(ii) $\text{Percent power} \div 100 \leq (\text{percent speed} \div 90)^{3.5}$.

(iii) $\text{Percent power} \div 100 < 3.0 \cdot (1 - \text{percent speed} \div 100)$.

(iv) $\text{Percent speed} \div 100 \geq 0.7$.

(3) Note that the line separating Subzone 1 and Subzone 2 includes the following endpoints:

(i) Percent speed = 78.9 percent; Percent power = 63.2 percent.

(ii) Percent speed = 84.6 percent; Percent power = 46.1 percent.

Figure 1 of Appendix III — NTE Zone and Subzones for Propeller-Law Marine Engines

(c) Figure 2 of this Appendix illustrates the default NTE zone for recreational marine engines certified using the duty cycle specified in § 1042.505(b)(2), except for variable-speed marine engines used with controllable-pitch propellers or with electrically coupled propellers, as follows:

(1) Subzone 1 is defined by the following boundaries:

- (i) Percent power + 100 $\geq 0.7 \cdot (\text{percent speed} + 100)^{2.5}$.
- (ii) Percent power + 100 $\leq (\text{percent speed} + 90)^{3.5}$.

- (iii) Percent power + 100 $\geq 3.0 \cdot (1 - \text{percent speed} + 100)$.
- (iv) Percent power ≤ 95 percent.

(2) Subzone 2 is defined by the following boundaries:

- (i) Percent power + 100 $\geq 0.7 \cdot (\text{percent speed} + 100)^{2.5}$.
- (ii) Percent power + 100 $\leq (\text{percent speed} + 90)^{3.5}$.
- (iii) Percent power + 100 $< 3.0 \cdot (1 - \text{percent speed} + 100)$.
- (iv) Percent speed ≥ 70 percent.

(3) Subzone 3 is defined by the following boundaries:

- (i) Percent power + 100 $\leq (\text{percent speed} + 90)^{3.5}$.

- (ii) Percent power > 95 percent.

(4) Note that the line separating Subzone 1 and Subzone 3 includes a point at Percent speed = 88.7 percent and Percent power = 95.0 percent. See paragraph (b)(3) of this appendix regarding the line separating Subzone 1 and Subzone 2.

Figure 2 of Appendix III — NTE Zone and Subzones for Propeller-Law Recreational Marine Engines

(d) Figure 3 of this Appendix illustrates the default NTE zone for variable-speed marine engines used with controllable-pitch propellers or with electrically coupled propellers that are certified using the duty cycle specified in § 1042.505(b)(1), (2), or (3), as follows:

(1) Subzone 1 is defined by the following boundaries:

- (i) Percent power + 100 $\geq 0.7 \cdot (\text{percent speed} + 100)^{2.5}$.
- (ii) Percent power + 100 $\geq 3.0 \cdot (1 - \text{percent speed} + 100)$.
- (iii) Percent speed ≥ 78.9 percent.

(2) Subzone 2a is defined by the following boundaries:

- (i) Percent power + 100 $\geq 0.7 \cdot (\text{percent speed} + 100)^{2.5}$.
- (ii) Percent speed ≥ 70 percent.
- (iii) Percent speed < 78.9 percent, for Percent power > 63.3 percent.
- (iv) Percent power + 100 $< 3.0 \cdot (1 - \text{percent speed} + 100)$, for Percent speed ≥ 78.9 percent.

(3) Subzone 2b is defined by the following boundaries:

- (i) The line formed by connecting the following two points on a plot of speed-vs.-power:

(A) Percent speed = 70 percent; Percent power = 28.7 percent.

(B) Percent power = 40 percent; Speed = governed speed.

(ii) Percent power + 100 $< 0.7 \cdot (\text{percent speed} + 100)^{2.5}$.

(4) Note that the line separating Subzone 1 and Subzone 2a includes the following endpoints:

(i) Percent speed = 78.9 percent; Percent power = 63.3 percent.

(ii) Percent speed = 84.6 percent; Percent power = 46.1 percent.

Figure 3 of Appendix III — NTE Zone and Subzones for Variable-Pitch or Electronically Coupled Engines*

*Shown for engines capable of operating on the E3 Duty Cycle.

(e) Figure 4 of this Appendix illustrates the default NTE zone for constant-speed engines certified using a duty cycle specified in § 1042.505(b)(3) or (4), as follows:

(1) Subzone 1 is defined by the following boundaries:
 (i) Percent power ≥ 70 percent.
 (ii) [Reserved]

(2) Subzone 2 is defined by the following boundaries:
 (i) Percent power < 70 percent.
 (ii) Percent power ≥ 40 percent.

Figure 4 of Appendix III — NTE Zone and Subzones for Constant-Speed Marine Engines

(f) Figure 5 of this Appendix illustrates the default NTE zone for variable-speed auxiliary marine engines certified using the duty cycle specified in § 1042.505(b)(5)(ii) or (iii), as follows:

(1) The default NTE zone is defined by the boundaries specified in 40 CFR 86.1370(b)(1), (2), and (4).

(2) A special PM subzone is defined in 40 CFR 1039.515(b).

Figure 5 of Appendix III — NTE Zone and Subzones for Variable-Speed Auxiliary Marine Engines (nonpropeller-law)

PART 1043—CONTROL OF NO_x, SO_x, AND PM EMISSIONS FROM MARINE ENGINES AND VESSELS SUBJECT TO THE MARPOL PROTOCOL

■ 233. The authority citation for part 1043 continues to read as follows:

Authority: 33 U.S.C. 1901–1912.

■ 234. Section 1043.60 is amended by revising paragraph (a) introductory text to read as follows:

§ 1043.60 Operating requirements for engines and vessels subject to this part.

* * * * *

(a) Except as specified otherwise in this part, NO_x emission limits apply to all engines with power output of more than 130 kW that will be installed on vessels subject to this part as specified in the following table:

* * * * *

■ 235. Section 1043.100 is revised to read as follows:

§ 1043.100 Incorporation by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the Federal

Register under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the Environmental Protection Agency must publish a document in the **Federal Register** and the material must be available to the public. All approved material is available for inspection at U.S. EPA, Air and Radiation Docket and Information Center, 1301 Constitution Ave. NW., Room B102, EPA West Building, Washington, DC 20460, (202) 202–1744, and is available from the sources listed below. It is also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call 202–741–6030, or go to: http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html.

(b) The International Maritime Organization, 4 Albert Embankment, London SE1 7SR, United Kingdom, or www.imo.org, or 44-(0)20–7735–7611.

(1) MARPOL Annex VI, Regulations for the Prevention of Air Pollution from Ships, Third Edition, 2013, and NO_x Technical Code 2008.

(i) Revised MARPOL Annex VI, Regulations for the Prevention of Pollution from Ships, Third Edition, 2013 (“2008 Annex VI”); IBR approved for §§ 1043.1 introductory text, 1043.20, 1043.30(f), 1043.60(c), and 1043.70(a).

(ii) NO_x Technical Code 2008, Technical Code on Control of Emission of Nitrogen Oxides from Marine Diesel Engines, 2013 Edition, (“NO_x Technical Code”); IBR approved for §§ 1043.20, 1043.41(b) and (h), and 1043.70(a).

(iii) Annex 12, Resolution MEPC.251(66) from the Report of the Marine Environment Protection Committee on its Sixty-Sixth Session, April 25, 2014. This document describes new and revised provisions that are considered to be part of Annex VI and NO_x Technical Code 2008 as referenced in paragraphs (b)(1)(i) and (ii) of this section. IBR approved for §§ 1043.1 introductory text, 1043.20, 1043.30(f), 1043.41(b) and (h), 1043.60(c), and 1043.70(a).

(2) [Reserved]

PART 1065—ENGINE-TESTING PROCEDURES

■ 236. The authority citation for part 1065 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Applicability and General Provisions

■ 237. Section 1065.10 is amended by revising paragraph (c)(1)(ii) to read as follows:

§ 1065.10 Other procedures.

(c) * * *

(1) * * *

(ii) Whether the unrepresentative aspect of the procedures affects your ability to show compliance with the applicable emission standards.

■ 238. Section 1065.15 is amended by revising paragraph (a)(2) to read as follows:

§ 1065.15 Overview of procedures for laboratory and field testing.

- (a) * * *
- (2) Hydrocarbon, HC, which may be expressed in the following ways:
- (i) Total hydrocarbon, THC.
- (ii) Nonmethane hydrocarbon, NMHC, which results from subtracting methane, CH₄, from THC.
- (iii) Nonmethane-nonethane hydrocarbon, NMNEHC, which results from subtracting methane, CH₄, and ethane, C₂H₆, from THC.
- (iv) Total hydrocarbon-equivalent, THCE, which results from adjusting THC mathematically to be equivalent on a carbon-mass basis.
- (v) Nonmethane hydrocarbon-equivalent, NMHCE, which results from adjusting NMHC mathematically to be equivalent on a carbon-mass basis.

Subpart B—Equipment Specifications

■ 239. Section 1065.140 is amended by revising paragraphs (d)(2) introductory text and (d)(3) introductory text to read as follows:

§ 1065.140 Dilution for gaseous and PM constituents.

- (d) * * *
- (2) *Constant dilution-ratio PFD.* Do one of the following for constant dilution-ratio PFD:
- (3) *Varying dilution-ratio PFD.* All the following provisions apply for varying dilution-ratio PFD:

■ 240. Section 1065.170 is amended by revising Figure 1 as follows:

§ 1065.170 Batch sampling for gaseous and PM constituents.

Figure 1 of § 1065.170—PM filter cassette specifications.

Subpart C—Measurement Instruments

■ 241. Section 1065.202 is amended by revising the introductory text to read as follows:

§ 1065.202 Data updating, recording, and control.

Your test system must be able to update data, record data and control systems related to operator demand, the dynamometer, sampling equipment, and

measurement instruments. Set up the measurement and recording equipment to avoid aliasing by ensuring that the sampling frequency is at least double that of the signal you are measuring, consistent with good engineering judgment; this may require increasing the sampling rate or filtering the signal. Use data acquisition and control systems that can record at the specified minimum frequencies, as follows:

■ 242. Section 1065.220 is amended by revising paragraph (a) introductory text to read as follows:

§ 1065.220 Fuel flow meter.

(a) *Application.* You may use fuel flow in combination with a chemical balance of fuel, inlet air, and raw exhaust to calculate raw exhaust flow as described in § 1065.655(f), as follows:

■ 243. Section 1065.225 is amended by revising paragraph (a) introductory text to read as follows:

§ 1065.225 Intake-air flow meter.

(a) *Application.* You may use an intake-air flow meter in combination with a chemical balance of fuel, inlet air, and exhaust to calculate raw exhaust flow as described in § 1065.655(f) and (g), as follows:

* * * * *

■ 244. Add § 1065.247 to read as follows:

§ 1065.247 Diesel exhaust fluid flow rate.

(a) *Application.* Determine diesel exhaust fluid flow rate over a test interval for batch or continuous emission sampling using one of the three methods described in this section.

(b) *ECM.* Use the ECM signal directly to determine diesel exhaust fluid flow rate. You may combine this with a gravimetric scale if that improves measurement quality. Prior to testing, you may characterize the ECM signal using a laboratory measurement and adjust the ECM signal, consistent with good engineering judgment.

(c) *Flow meter.* Measure diesel exhaust fluid flow rate with a flow meter. We recommend that the flow meter that meets the specifications in Table 1 of § 1065.205. Note that your overall system for measuring diesel exhaust fluid flow must meet the linearity verification in § 1065.307. Measure using the following procedure:

(1) Condition the flow of diesel exhaust fluid as needed to prevent wakes, eddies, circulating flows, or flow pulsations from affecting the accuracy or repeatability of the meter. You may accomplish this by using a sufficient length of straight tubing (such as a length equal to at least 10 pipe diameters) or by using specially designed tubing bends, straightening fins, or pneumatic pulsation dampeners to establish a steady and predictable velocity profile upstream of the meter. Condition the flow as needed to prevent any gas bubbles in the fluid from affecting the flow meter.

(2) Account for any fluid that bypasses the engine or returns from the engine to the fluid storage tank.

(d) *Gravimetric scale.* Use a gravimetric scale to determine the mass of diesel exhaust fluid the engine uses over a discrete-mode test interval and divide by the time of the test interval.

■ 245. Section 1065.260 is amended by revising paragraphs (e) and (f) and adding paragraph (g) to read as follows:

§ 1065.260 Flame-ionization detector.

* * * * *

(e) *NMHC and NMOG.* For demonstrating compliance with NMHC standards, you may either measure THC or determine NMHC mass as described in § 1065.660(b)(1), or you may measure THC and CH₄ and determine NMHC as described in § 1065.660(b)(2) or (3). For gaseous-fueled engines, you may also use the additive method in § 1065.660(b)(4). See 40 CFR 1066.635 for methods to demonstrate compliance with NMOG standards for vehicle testing.

(f) *NMNEHC.* For demonstrating compliance with NMNEHC standards, you may either measure NMHC or determine NMNEHC mass as described in § 1065.660(c)(1), you may measure THC, CH₄, and C₂H₆ and determine NMNEHC as described in § 1065.660(c)(2), or you may use the additive method in § 1065.660(c)(3).

(g) *CH₄.* For reporting CH₄ or for demonstrating compliance with CH₄ standards, you may use a FID analyzer with a nonmethane cutter as described in § 1065.265 or you may use a GC-FID as described in § 1065.267. Determine CH₄ as described in § 1065.660(d).

■ 246. Add § 1065.266 to subpart C to read as follows:

§ 1065.266 Fourier transform infrared analyzer.

(a) *Application.* For engines that run only on natural gas, you may use a Fourier transform infrared (FTIR) analyzer to measure nonmethane hydrocarbon (NMHC) and nonmethane-nonethane hydrocarbon (NMNEHC) for continuous sampling. You may use an FTIR analyzer with any gaseous-fueled engine, including dual-fuel engines, to measure CH₄ and C₂H₆, for either batch or continuous sampling (for subtraction from THC).

(b) *Component requirements.* We recommend that you use an FTIR analyzer that meets the specifications in Table 1 of § 1065.205. Note that your FTIR-based system must meet the linearity verification in § 1065.307. Use appropriate analytical procedures for interpretation of infrared spectra. For example, EPA Test Method 320 (see <https://www3.epa.gov/ttn/emc/promgate/m-320.pdf>) and ASTM D6348 (incorporated by reference in § 1065.1010) are considered valid methods for spectral interpretation. You must use heated FTIR analyzers that maintain all surfaces that are exposed to emissions at a temperature of (110 to 202) °C.

(c) *Hydrocarbon species for NMHC and NMNEHC additive determination.* To determine NMNEHC, measure ethene, ethyne, propane, propene, butane, formaldehyde, acetaldehyde,

formic acid, and methanol. To determine NMHC, measure ethane in addition to those same hydrocarbon species. Determine NMHC and NMNEHC as described in § 1065.660(b)(4) and § 1065.660(c)(3).

(d) *NMHC and NMNEHC CH₄ and C₂H₆ determination* from subtraction of CH₄ and C₂H₆ from THC. Determine CH₄ as described in § 1065.660(d)(2) and C₂H₆ as described § 1065.660(e). Determine NMHC from subtraction of CH₄ from THC as described in § 1065.660(b)(3) and NMNEHC from subtraction of CH₄ and C₂H₆ as described § 1065.660(c)(2). Determine CH₄ as described in § 1065.660(d)(2) and C₂H₆ as described § 1065.660(e).

(e) *Interference verification.* Perform interference verification for FTIR analyzers using the procedures of § 1065.366. Certain interference gases can interfere with FTIR analyzers by causing a response similar to the hydrocarbon species of interest. When running the interference verification for these analyzers, use interference gases as follows:

(1) The interference gases for CH₄ are CO₂, H₂O, and C₂H₆.

(2) The interference gases for C₂H₆ are CO₂, H₂O, and CH₄.

(3) The interference gases for other measured hydrocarbon species are CO₂, H₂O, CH₄, and C₂H₆.

■ 247. Section 1065.267 is amended by revising paragraph (a) to read as follows:

§ 1065.267 Gas chromatograph with a flame ionization detector.

(a) *Application.* You may use a gas chromatograph with a flame ionization detector (GC-FID) to measure CH₄ and C₂H₆ concentrations of diluted exhaust for batch sampling. While you may also use a nonmethane cutter to measure CH₄, as described in § 1065.265, use a reference procedure based on a gas chromatograph for comparison with any proposed alternate measurement procedure under § 1065.10.

* * * * *

■ 248. Section 1065.275 is amended by revising paragraph (b)(2) to read as follows:

§ 1065.275 N₂O measurement devices.

* * * * *

(b) * * *
(2) Fourier transform infrared (FTIR) analyzer. Use appropriate analytical procedures for interpretation of infrared spectra. For example, EPA Test Method 320 (see <https://www3.epa.gov/ttn/emc/promgate/m-320.pdf>) and ASTM D6348 (incorporated by reference in § 1065.1010) are considered valid methods for spectral interpretation.

* * * * *

Subpart D—Calibrations and Verifications**§ 1065.303 Summary of required calibration and verifications.**

subpart and indicates when these have to be performed:

■ 249. Section 1065.303 is revised to read as follows:

The following table summarizes the required and recommended calibrations and verifications described in this

TABLE 1 OF § 1065.303—SUMMARY OF REQUIRED CALIBRATION AND VERIFICATIONS

Type of calibration or verification	Minimum frequency ¹
§ 1065.305: Accuracy, repeatability and noise	Accuracy: Not required, but recommended for initial installation. Repeatability: Not required, but recommended for initial installation. Noise: Not required, but recommended for initial installation.
§ 1065.307: Linearity verification	Speed: Upon initial installation, within 370 days before testing and after major maintenance. Torque: Upon initial installation, within 370 days before testing and after major maintenance. Electrical power, current, and voltage: Upon initial installation, within 370 days before testing and after major maintenance. ² Fuel flow rate: Upon initial installation, within 370 days before testing, and after major maintenance. DEF flow: Upon initial installation, within 370 days before testing, and after major maintenance. Intake-air, dilution air, diluted exhaust, and batch sampler flow rates: Upon initial installation, within 370 days before testing and after major maintenance, unless flow is verified by propane check or by carbon or oxygen balance. Raw exhaust flow rate: Upon initial installation, within 185 days before testing and after major maintenance, unless flow is verified by propane check or by carbon or oxygen balance. Gas dividers: Upon initial installation, within 370 days before testing, and after major maintenance. Gas analyzers (unless otherwise noted): Upon initial installation, within 35 days before testing and after major maintenance. FTIR and photoacoustic analyzers: Upon initial installation, within 370 days before testing and after major maintenance. GC-ECD: Upon initial installation and after major maintenance. PM balance: Upon initial installation, within 370 days before testing and after major maintenance. Pressure, temperature, and dewpoint: Upon initial installation, within 370 days before testing and after major maintenance.
§ 1065.308: Continuous gas analyzer system response and updating-recording verification—for gas analyzers not continuously compensated for other gas species.	Upon initial installation or after system modification that would affect response.
§ 1065.309: Continuous gas analyzer system-response and updating-recording verification—for gas analyzers continuously compensated for other gas species.	Upon initial installation or after system modification that would affect response.
§ 1065.310: Torque	Upon initial installation and after major maintenance.
§ 1065.315: Pressure, temperature, dewpoint	Upon initial installation and after major maintenance.
§ 1065.320: Fuel flow	Upon initial installation and after major maintenance.
§ 1065.325: Intake flow	Upon initial installation and after major maintenance.
§ 1065.330: Exhaust flow	Upon initial installation and after major maintenance.
§ 1065.340: Diluted exhaust flow (CVS)	Upon initial installation and after major maintenance.
§ 1065.341: CVS and batch sampler verification ³	Upon initial installation, within 35 days before testing, and after major maintenance.
§ 1065.342 Sample dryer verification	For thermal chillers: Upon installation and after major maintenance. For osmotic membranes: Upon installation, within 35 days of testing, and after major maintenance.
§ 1065.345: Vacuum leak	For laboratory testing: Upon initial installation of the sampling system, within 8 hours before the start of the first test interval of each duty-cycle sequence, and after maintenance such as pre-filter changes. For field testing: After each installation of the sampling system on the vehicle, prior to the start of the field test, and after maintenance such as pre-filter changes.
§ 1065.350: CO ₂ NDIR H ₂ O interference	Upon initial installation and after major maintenance.
§ 1065.355: CO NDIR CO ₂ and H ₂ O interference	Upon initial installation and after major maintenance.
§ 1065.360: FID calibration THC FID optimization, and THC FID verification.	Calibrate all FID analyzers: Upon initial installation and after major maintenance. Optimize and determine CH ₄ response for THC FID analyzers: Upon initial installation and after major maintenance. Verify CH ₄ response for THC FID analyzers: Upon initial installation, within 185 days before testing, and after major maintenance. Verify C ₂ H ₆ response for THC FID analyzers if used for NMNEHC determination: Upon initial installation, within 185 days before testing, and after major maintenance.
§ 1065.362: Raw exhaust FID O ₂ interference	For all FID analyzers: Upon initial installation, and after major maintenance. For THC FID analyzers: Upon initial installation, after major maintenance, and after FID optimization according to § 1065.360.

TABLE 1 OF § 1065.303—SUMMARY OF REQUIRED CALIBRATION AND VERIFICATIONS—Continued

Type of calibration or verification	Minimum frequency ¹
§ 1065.365: Nonmethane cutter penetration	Upon initial installation, within 185 days before testing, and after major maintenance.
§ 1065.366: Interference verification for FTIR analyzers.	Upon initial installation and after major maintenance.
§ 1065.369: H ₂ O, CO, and CO ₂ interference verification for ethanol photoacoustic analyzers.	Upon initial installation and after major maintenance.
§ 1065.370: CLD CO ₂ and H ₂ O quench	Upon initial installation and after major maintenance.
§ 1065.372: NDUV HC and H ₂ O interference	Upon initial installation and after major maintenance.
§ 1065.375: N ₂ O analyzer interference	Upon initial installation and after major maintenance.
§ 1065.376: Chiller NO ₂ penetration	Upon initial installation and after major maintenance.
§ 1065.378: NO ₂ -to-NO converter conversion	Upon initial installation, within 35 days before testing, and after major maintenance.
§ 1065.390: PM balance and weighing	Independent verification: Upon initial installation, within 370 days before testing, and after major maintenance. Zero, span, and reference sample verifications: Within 12 hours of weighing, and after major maintenance.
§ 1065.395: Inertial PM balance and weighing	Independent verification: Upon initial installation, within 370 days before testing, and after major maintenance. Other verifications: Upon initial installation and after major maintenance.

¹ Perform calibrations and verifications more frequently than we specify, according to measurement system manufacturer instructions and good engineering judgment.

² Perform linearity verification either for electrical power or for current and voltage.

³ The CVS verification described in § 1065.341 is not required for systems that agree within ±2% based on a chemical balance of carbon or oxygen of the intake air, fuel, and diluted exhaust.

■ 250. Section 1065.340 is amended by revising paragraphs (e), (f)(8), (f)(13), (g), (h), and Figure 1 to read as follows:

§ 1065.340 Diluted exhaust flow (CVS) calibration.

* * * * *

(e) *Configuration*. Calibrate the system with any upstream screens or other restrictions that will be used during testing and that could affect the flow ahead of the CVS flow meter, using good engineering judgment to minimize the effect on the flow distribution. You may not use any upstream screen or other restriction that could affect the flow ahead of the reference flow meter, unless the flow meter has been calibrated with such a restriction. In the case of a free standing SSV reference flow meter, you may not have any upstream screens.

(f) * * *

(8) Repeat the steps in paragraphs (e)(6) and (7) of this section to record data at a minimum of six restrictor positions ranging from the wide open restrictor position to the minimum expected pressure at the PDP inlet or the maximum expected differential (outlet minus inlet) pressure across the PDP during testing.

* * * * *

(13) During emission testing ensure that the PDP is not operated either below the lowest inlet pressure point or above the highest differential pressure point in the calibration data.

(g) *SSV calibration*. Calibrate a subsonic venturi (SSV) to determine its calibration coefficient, C_d , for the expected range of inlet pressures. Calibrate an SSV flow meter as follows:

(1) Connect the system as shown in Figure 1 of this section.

(2) Verify that any leaks between the calibration flow meter and the SSV are less than 0.3% of the total flow at the highest restriction.

(3) Start the blower downstream of the SSV.

(4) While the SSV operates, maintain a constant temperature at the SSV inlet within ±2% of the mean absolute inlet temperature,

\bar{T}_{in} .

(5) Set the variable restrictor or variable-speed blower to a flow rate greater than the greatest flow rate expected during testing. You may not extrapolate flow rates beyond calibrated values, so we recommend that you make sure the Reynolds number, $Re^\#$, at the SSV throat at the greatest calibrated flow rate is greater than the maximum $Re^\#$ expected during testing.

(6) Operate the SSV for at least 3 min to stabilize the system. Continue operating the SSV and record the mean of at least 30 seconds of sampled data of each of the following quantities:

(i) The mean flow rate of the reference flow meter \bar{n}_{ref} . This may include several measurements of different quantities for calculating \bar{n}_{ref} , such as reference meter pressures and temperatures.

(ii) Optionally, the mean dewpoint of the calibration air, \bar{T}_{dew} . See § 1065.640 for permissible assumptions.

(iii) The mean temperature at the venturi inlet, \bar{T}_{in} .

(iv) The mean static absolute pressure at the venturi inlet, \bar{P}_{in} .

(v) The mean static differential pressure between the static pressure at

the venturi inlet and the static pressure at the venturi throat, $\Delta\bar{P}_{SSV}$.

(7) Incrementally close the restrictor valve or decrease the blower speed to decrease the flow rate.

(8) Repeat the steps in paragraphs (g)(6) and (7) of this section to record data at a minimum of ten flow rates.

(9) Determine an equation to quantify C_d as a function of $Re^\#$ by using the collected data and the equations in § 1065.640. Section 1065.640 also includes statistical criteria for validating the C_d versus $Re^\#$ equation.

(10) Verify the calibration by performing a CVS verification (*i.e.*, propane check) as described in § 1065.341 using the new C_d versus $Re^\#$ equation.

(11) Use the SSV only between the minimum and maximum calibrated $Re^\#$. If you want to use the SSV at a lower or higher $Re^\#$, you must recalibrate the SSV.

(12) Use the equations in § 1065.642 to determine SSV flow during a test.

(h) *CFV calibration*. Calibrate a critical-flow venturi (CFV) to verify its discharge coefficient, C_d , up to the highest expected pressure ratio, r , according to § 1065.640. Calibrate a CFV flow meter as follows:

(1) Connect the system as shown in Figure 1 of this section.

(2) Verify that any leaks between the calibration flow meter and the CFV are less than 0.3% of the total flow at the highest restriction.

(3) Start the blower downstream of the CFV.

(4) While the CFV operates, maintain a constant temperature at the CFV inlet

within $\pm 2\%$ of the mean absolute inlet temperature, \bar{T}_{in} .

(5) Set the variable restrictor to its wide-open position. Instead of a variable restrictor, you may alternately vary the pressure downstream of the CFV by varying blower speed or by introducing a controlled leak. Note that some blowers have limitations on nonloaded conditions.

(6) Operate the CFV for at least 3 min to stabilize the system. Continue operating the CFV and record the mean values of at least 30 seconds of sampled data of each of the following quantities:

(i) The mean flow rate of the reference flow meter, \bar{n}_{ref} . This may include several measurements of different quantities, such as reference meter pressures and temperatures, for calculating \bar{n}_{ref} .

(ii) The mean dewpoint of the calibration air, \bar{T}_{dew} . See § 1065.640 for permissible assumptions during emission measurements.

(iii) The mean temperature at the venturi inlet, \bar{T}_{in} .

(iv) The mean static absolute pressure at the venturi inlet, \bar{P}_{in} .

(v) The mean static differential pressure between the CFV inlet and the CFV outlet, $\Delta\bar{P}_{CFV}$.

(7) Incrementally close the restrictor valve or decrease the downstream pressure to decrease the differential pressure across the CFV, ΔP_{CFV} .

(8) Repeat the steps in paragraphs (f)(6) and (7) of this section to record mean data at a minimum of ten restrictor positions, such that you test the fullest practical range of $\Delta\bar{P}_{CFV}$ expected during testing. We do not require that you remove calibration components or CVS components to calibrate at the lowest possible restrictions.

(9) Determine C_d and the highest allowable pressure ratio, r , according to § 1065.640.

(10) Use C_d to determine CFV flow during an emission test. Do not use the CFV above the highest allowed r , as determined in § 1065.640.

(11) Verify the calibration by performing a CVS verification (*i.e.*, propane check) as described in § 1065.341.

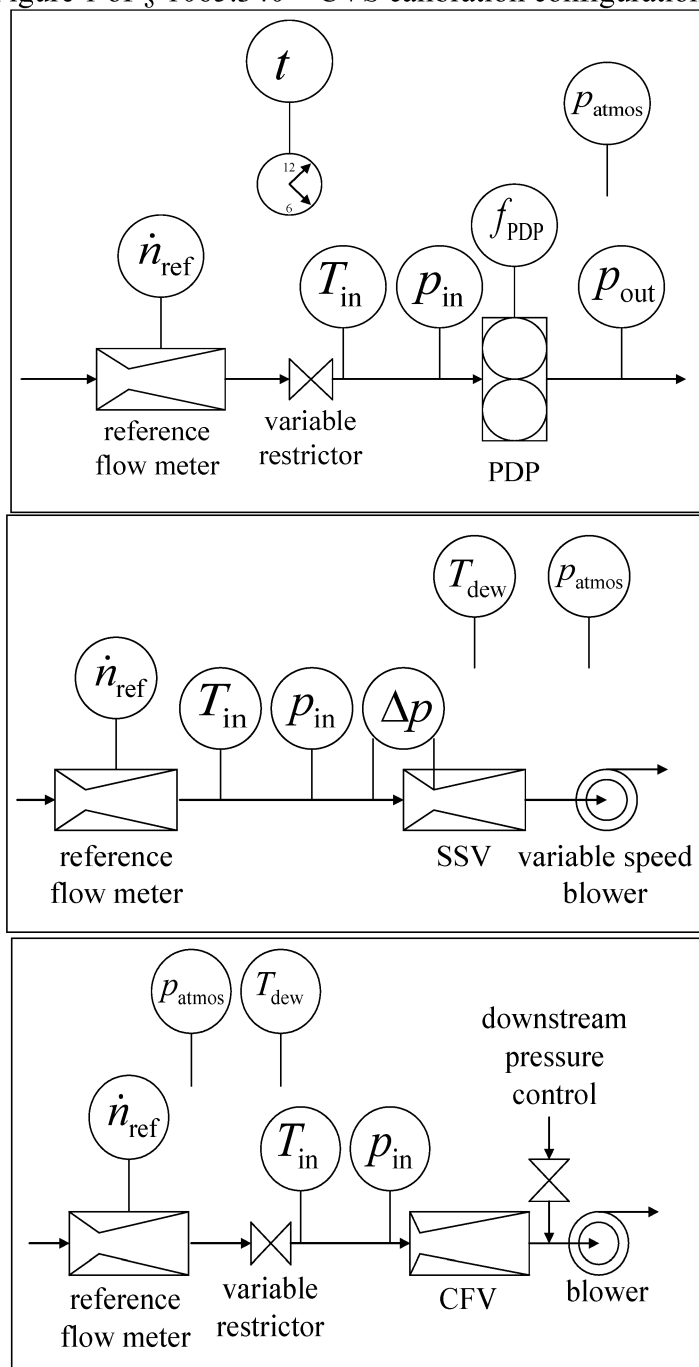

(12) If your CVS is configured to operate more than one CFV at a time in parallel, calibrate your CVS by one of the following:

(i) Calibrate every combination of CFVs according to this section and § 1065.640. Refer to § 1065.642 for instructions on calculating flow rates for this option.

(ii) Calibrate each CFV according to this section and § 1065.640. Refer to § 1065.642 for instructions on calculating flow rates for this option.

* * * * *

Figure 1 of § 1065.340—CVS calibration configurations.

BILLING CODE 6550-50-C

■ 251. Section 1065.341 is amended by revising paragraph (c)(3) to read as follows:

§ 1065.341 CVS, PFD, and batch sampler verification (propane check).

* * * * *

(c) * * *

(3) Select a C_3H_8 injection port in the CVS. Select the port location to be as close as practical to the location where you introduce engine exhaust into the CVS, or at some point in the laboratory

exhaust tubing upstream of this location. Connect the C_3H_8 cylinder to the injection system.

* * * * *

■ 252. Section 1065.345 is amended by revising paragraphs (d)(2), (d)(4), (e)(3), and (e)(4) to read as follows:

§ 1065.345 Vacuum-side leak verification.

* * * * *

(d) * * *

(2) Supply span gas to the analyzer span port and record the measured value.

* * * * *

(4) Verify that the measured overflow span gas concentration is within $\pm 0.5\%$ of the concentration measured in paragraph (d)(2) of this section. A measured value lower than expected indicates a leak, but a value higher than expected may indicate a problem with the span gas or the analyzer itself. A measured value higher than expected does not indicate a leak.

(e) * * *

(3) Turn off the sample pumps and seal the system. Measure and record the absolute pressure of the trapped gas and optionally the system absolute temperature. Wait long enough for any transients to settle and long enough for a leak at 0.5% to have caused a pressure change of at least 10 times the resolution of the pressure transducer, then again record the pressure and optionally temperature.

(4) Calculate the leak flow rate based on an assumed value of zero for pumped-down bag volumes and based on known values for the sample system volume, the initial and final pressures, optional temperatures, and elapsed time. Using the calculations specified in § 1065.644, verify that the vacuum-decay leak flow rate is less than 0.5% of the system's normal in-use flow rate.

■ 253. Section 1065.360 is amended by revising paragraphs (a)(3), (d) introductory text, and (d)(7) and adding paragraph (f) to read as follows:

§ 1065.360 FID optimization and verification.

(a) * * *

(3) If you determine NMNEHC by subtracting from measured THC, determine the ethane (C₂H₆) response factor after initial analyzer installation and after major maintenance as described in paragraph (f) of this section. Verify the C₂H₆ response within 185 days before testing as described in paragraph (f) of this section.

* * * * *

(d) *THC FID CH₄ response factor determination.* This procedure is only for FID analyzers that measure THC. Since FID analyzers generally have a different response to CH₄ versus C₃H₈, determine the THC-FID analyzer's CH₄ response factor, $RF_{CH_4[THC-FID]}$, after FID optimization. Use the most recent $RF_{CH_4[THC-FID]}$ measured according to this section in the calculations for HC determination described in § 1065.660 to compensate for CH₄ response. Determine $RF_{CH_4[THC-FID]}$ as follows, noting that you do not determine $RF_{CH_4[THC-FID]}$ for FIDs that are calibrated and spanned using CH₄ with a nonmethane cutter:

* * * * *

(7) Introduce the CH₄ span gas that you selected under paragraph (d)(2) of this section into the FID analyzer.

* * * * *

(f) *THC FID C₂H₆ response factor determination.* This procedure is only for FID analyzers that measure THC. Since FID analyzers generally have a different response to C₂H₆ than C₃H₈, determine the THC-FID analyzer's C₂H₆

response factor, $RF_{C_2H_6[THC-FID]}$, after FID optimization using the procedure described in paragraph (d) of this section, replacing CH₄ with C₂H₆. Use the most recent $RF_{C_2H_6[THC-FID]}$ measured according to this section in the calculations for HC determination described in § 1065.660 to compensate for C₂H₆ response.

■ 254. Section 1065.365 is amended by revising paragraphs (d)(9), (e)(10), (f)(9), and (f)(14) to read as follows:

§ 1065.365 Nonmethane cutter penetration fractions.

* * * * *

(d) * * *

(9) Divide the mean C₂H₆ concentration by the reference concentration of C₂H₆, converted to a C₁ basis. The result is the C₂H₆ combined response factor and penetration fraction, $RF_{PF_{C_2H_6[NMC-FID]}}$. Use this combined response factor and penetration fraction and the product of the CH₄ response factor and CH₄ penetration fraction, $RF_{PF_{CH_4[NMC-FID]}}$, set to 1.0 in emission calculations according to § 1065.660(b)(2)(i), § 1065.660(d)(1)(i), or § 1065.665, as applicable.

(e) * * *

(10) Divide the mean C₂H₆ concentration measured through the nonmethane cutter by the mean C₂H₆ concentration measured after bypassing the nonmethane cutter. The result is the C₂H₆ penetration fraction, $PF_{C_2H_6[NMC-FID]}$. Use this penetration fraction according to § 1065.660(b)(2)(ii), § 1065.660(d)(1)(ii), or § 1065.665, as applicable.

* * * * *

(f) * * *

(9) Divide the mean C₂H₆ concentration by the reference concentration of C₂H₆, converted to a C₁ basis. The result is the C₂H₆ combined response factor and penetration fraction, $RF_{PF_{C_2H_6[NMC-FID]}}$. Use this combined response factor and penetration fraction according to § 1065.660(b)(2)(iii), § 1065.660(d)(1)(iii), or § 1065.665, as applicable.

* * * * *

(14) Divide the mean CH₄ concentration measured through the nonmethane cutter by the mean CH₄ concentration measured after bypassing the nonmethane cutter. The result is the CH₄ penetration fraction, $PF_{CH_4[NMC-FID]}$. Use this penetration fraction according to § 1065.660(b)(2)(iii), § 1065.660(d)(1)(iii), or § 1065.665, as applicable.

■ 255. Section 1065.366 is added to subpart D to read as follows:

§ 1065.366 Interference verification for FTIR analyzers.

(a) *Scope and frequency.* If you measure CH₄, C₂H₆, NMHC, or NMNEHC using an FTIR analyzer, verify the amount of interference after initial analyzer installation and after major maintenance.

(b) *Measurement principles.*

Interference gases can interfere with certain analyzers by causing a response similar to the target analyte. If the analyzer uses compensation algorithms that utilize measurements of other gases to meet this interference verification, simultaneously conduct these other measurements to test the compensation algorithms during the analyzer interference verification.

(c) *System requirements.* An FTIR analyzer must have combined interference that is within ±2% of the flow-weighted mean concentration of CH₄, NMHC, or NMNEHC expected at the standard, though we strongly recommend a lower interference that is within ±1%.

(d) *Procedure.* Perform the interference verification for an FTIR analyzer using the same procedure that applies for N₂O analyzers in § 1065.375(d).

■ 256. Section 1065.370 is amended by revising paragraph (d)(11) to read as follows:

§ 1065.370 CLD CO₂ and H₂O quench verification.

* * * * *

(d) * * *

(11) Calculate the actual NO concentration at the gas divider's outlet, X_{NOact} , based on the span gas concentrations and x_{CO_2act} according to Eq. 1065.675–2. Use the calculated value in the quench verification calculations in Eq. 1065.675–1.

* * * * *

■ 257. Section 1065.375 is amended by revising paragraph (b) to read as follows:

§ 1065.375 Interference verification for N₂O analyzers.

* * * * *

(b) *Measurement principles.*

Interference gases can positively interfere with certain analyzers by causing a response similar to N₂O. If the analyzer uses compensation algorithms that utilize measurements of other gases to meet this interference verification, simultaneously conduct these other measurements to test the compensation algorithms during the analyzer interference verification.

* * * * *

■ 258. Section 1065.390 is amended by revising paragraphs (b), (c) introductory text, and (c)(2) to read as follows:

§ 1065.390 PM balance verifications and weighing process verification.

(b) *Independent verification.* Have the balance manufacturer (or a representative approved by the balance manufacturer) verify the balance performance within 370 days of testing. Balances have internal weights that compensate for drift due to environmental changes. These internal weights must be verified as part of this independent verification with external, certified calibration weights that meet the specifications in § 1065.790.

(c) *Zeroing and spanning.* You must verify balance performance by zeroing and spanning it with at least one calibration weight. Also, any external weights you use must meet the specifications in § 1065.790. Any weights internal to the PM balance used for this verification must be verified as described in paragraph (b) of this section.

(2) You may use an automated procedure to verify balance performance. For example most balances have internal weights for automatically verifying balance performance.

Subpart F—Performing an Emission Test in the Laboratory

■ 259. Section 1065.510 is amended by revising paragraphs (c) introductory text, (c)(4), and (d)(5)(i) and (iii) to read as follows:

§ 1065.510 Engine mapping.

(c) *Negative torque mapping.* If your engine is subject to a reference duty cycle that specifies negative torque values (*i.e.*, engine motoring), generate a motoring torque curve by any of the following procedures:

(4) For engines with an electric hybrid system, map the negative torque required to motor the engine and absorb any power delivered from the RESS by repeating paragraph (g)(2) of this section with minimum operator demand, stopping the sweep to discharge the RESS when the absolute instantaneous power measured from the RESS drops below the expected maximum absolute power from the RESS by more than 2% of total system maximum power (including engine motoring and RESS power) as determined from mapping the negative torque.

(d) * * *

(5) * * *

(i) For constant-speed engines subject only to steady-state testing, you may perform an engine map by using a series of discrete torques. Select at least five evenly spaced torque setpoints from no-load to 80% of the manufacturer-declared test torque or to a torque derived from your published maximum power level if the declared test torque is unavailable. Starting at the 80% torque point, select setpoints in 2.5% or smaller intervals, stopping at the endpoint torque. The endpoint torque is defined as the first discrete mapped torque value greater than the torque at maximum observed power where the engine outputs 90% of the maximum observed power; or the torque when engine stall has been determined using good engineering judgment (*i.e.* sudden deceleration of engine speed while adding torque). You may continue mapping at higher torque setpoints. At each setpoint, allow torque and speed to stabilize. Record the mean feedback speed and torque at each setpoint. From this series of mean feedback speed and torque values, use linear interpolation to determine intermediate values. Use this series of mean feedback speeds and torques to generate the power map as described in paragraph (e) of this section.

(iii) For any isochronous governed (0% speed droop) constant-speed engine, you may map the engine with two points as described in this paragraph (d)(5)(iii). After stabilizing at the no-load governed speed in paragraph (d)(4) of this section, record the mean feedback speed and torque. Continue to operate the engine with the governor or simulated governor controlling engine speed using operator demand, and control the dynamometer to target a speed of 99.5% of the recorded mean no-load governed speed. Allow speed and torque to stabilize. Record the mean feedback speed and torque. Record the target speed. The absolute value of the speed error (the mean feedback speed minus the target speed) must be no greater than 0.1% of the recorded mean no-load governed speed. From this series of two mean feedback speed and torque values, use linear interpolation to determine intermediate values. Use this series of two mean feedback speeds and torques to generate a power map as described in paragraph (e) of this section. Note that the measured maximum test torque as determined in § 1065.610 (b)(1) will be the mean feedback torque recorded on the second point.

■ 260. Section 1065.546 is amended by revising paragraph (a) to read as follows:

§ 1065.546 Verification of minimum dilution ratio for PM batch sampling.

(a) Determine minimum dilution ratio based on molar flow data. This involves determination of at least two of the following three quantities: raw exhaust flow (or previously diluted flow), dilution air flow, and dilute exhaust flow. You may determine the raw exhaust flow rate based on the measured intake air or fuel flow rate and the raw exhaust chemical balance terms as given in § 1065.655(f). You may determine the raw exhaust flow rate based on the measured intake air and dilute exhaust molar flow rates and the dilute exhaust chemical balance terms as given in § 1065.655(g). You may alternatively estimate the molar raw exhaust flow rate based on intake air, fuel rate measurements, and fuel properties, consistent with good engineering judgment.

■ 261. Section 1065.590 is amended by revising paragraphs (f)(2), (j) introductory text, and (j)(3) through (7) to read as follows:

§ 1065.590 PM sampling media (e.g., filters) preconditioning and tare weighing.

(f) * * *

(2) Use good engineering judgment to determine if substitution weighing is necessary to show that an engine meets the applicable standard. You may follow the substitution weighing procedure in paragraph (j) of this section, or you may develop your own procedure.

(j) Substitution weighing involves measurement of a reference weight before and after each weighing of the PM sampling medium (*e.g.*, the filter). While substitution weighing requires more measurements, it corrects for a balance's zero-drift and it relies on balance linearity only over a small range. This is most advantageous when quantifying net PM masses that are less than 0.1% of the sample medium's mass. However, it may not be advantageous when net PM masses exceed 1% of the sample medium's mass. If you utilize substitution weighing, it must be used for both pre-test and post-test weighing. The same substitution weight must be used for both pre-test and post-test weighing. Correct the mass of the substitution weight for buoyancy if the density of the substitution weight is less than 2.0 g/

cm³. The following steps are an example of substitution weighing:

* * * * *

(3) Select and weigh a substitution weight that meets the requirements for calibration weights found in § 1065.790. The substitution weight must also have the same density as the weight you use to span the microbalance, and be similar in mass to an unused sample medium (e.g., filter). A 47 mm PTFE membrane filter will typically have a mass in the range of 80 to 100 mg.

(4) Record the stable balance reading, then remove the substitution weight.

(5) Weigh an unused sample medium (e.g., a new filter), record the stable balance reading and record the balance environment's dewpoint, ambient temperature, and atmospheric pressure.

(6) Reweigh the substitution weight and record the stable balance reading.

(7) Calculate the arithmetic mean of the two substitution-weight readings that you recorded immediately before and after weighing the unused sample. Subtract that mean value from the unused sample reading, then add the true mass of the substitution weight as stated on the substitution-weight certificate. Record this result. This is the unused sample's tare weight without correcting for buoyancy.

* * * * *

Subpart G—Calculations and Data Requirements

■ 262. Section 1065.602 is amended by revising paragraphs (f)(1) introductory

text, (f)(2) introductory text, and (j) to read as follows:

§ 1065.602 Statistics.

* * * * *

(f) * * *

(1) For an unpaired *t*-test, calculate the *t* statistic and its number of degrees of freedom, *v*, as follows:

* * * * *

(2) For a paired *t*-test, calculate the *t* statistic and its number of degrees of freedom, *v*, as follows, noting that the *e_i* are the errors (e.g., differences) between each pair of *y_{refi}* and *y_i*:

* * * * *

(j) *Standard estimate of error.*
Calculate a standard estimate of error, *SEE*, as follows:

$$SEE_y = \sqrt{\frac{\sum_{i=1}^N [y_i - a_{0y} - (a_{1y} \cdot y_{refi})]^2}{N - 2}}$$

Eq. 1065.602-11

Eq. 1065.602-11

Example:

N = 6000

y₁ = 2045.8

a_{0y} = -16.8083

a_{1y} = 1.0110

y_{ref1} = 2045.0

$$SEE_y = \sqrt{\frac{[2045.8 - (-16.8083) - (1.0110 \cdot 2045.0)]^2 + \dots [y_{6000} - (-16.8083) - (1.0110 \cdot y_{ref6000})]^2}{6000 - 2}}$$

SEE_y = 5.348

* * * * *

■ 263. Section 1065.610 is amended by revising paragraphs (a)(1)(ii), (a)(1)(iii), (a)(1)(vi), (a)(2), (b), and (c)(1) and (2) to read as follows:

§ 1065.610 Duty-cycle generation.

* * * * *

(a) * * *

(1) * * *

(ii) Determine the lowest and highest engine speeds corresponding to 98% of *P_{max}*, using linear interpolation, and no extrapolation, as appropriate.

(iii) Determine the engine speed corresponding to maximum power, *f_{nPmax}*, by calculating the average of the two speed values from paragraph

(a)(1)(ii) of this section. If there is only one speed where power is equal to 98% of *P_{max}*, take *f_{nPmax}* as the speed at which *P_{max}* occurs.

* * * * *

(vi) Determine the lowest and highest engine speeds corresponding to the value calculated in paragraph (a)(1)(v) of this section, using linear interpolation as appropriate. Calculate *f_{ntest}* as the average of these two speed values. If there is only one speed corresponding to the value calculated in paragraph (a)(1)(v) of this section, take *f_{ntest}* as the speed where the maximum of the sum of the squares occurs.

* * * * *

(2) For engines with a high-speed governor that will be subject to a reference duty cycle that specifies normalized speeds greater than 100%, calculate an alternate maximum test speed, *f_{ntest,alt}*, as specified in this paragraph (a)(2). If *f_{ntest,alt}* is less than the measured maximum test speed, *f_{ntest}*, determined in paragraph (a)(1) of this section, replace *f_{ntest}* with *f_{ntest,alt}*. In this case, *f_{ntest,alt}* becomes the “maximum test speed” for that engine. Note that § 1065.510 allows you to apply an optional declared maximum test speed to the final measured maximum test speed determined as an outcome of the comparison between *f_{ntest}*, and *f_{ntest,alt}* in this paragraph (a)(2). Determine *f_{ntest,alt}* as follows:

$$f_{ntest,alt} = \frac{f_{nhi,idle} - f_{nidle}}{\%speed_{max}} + f_{nidle}$$

Eq. 1065.610-2

Where:

$f_{ntest,alt}$ = alternate maximum test speed
 $f_{nhi,idle}$ = warm high-idle speed

f_{nidle} = warm idle speed
 $\% speed_{max}$ = maximum normalized speed
 from duty cycle

Example:
 $f_{nhi,idle}$ = 2200 r/min
 f_{nidle} = 800 r/min

$$f_{ntest,alt} = \frac{2200 - 800}{1.05} + 800$$

$f_{ntest,alt} = 2133$ r/min

* * * * *

(b) *Maximum test torque, T_{test} .* For constant-speed engines, determine the measured T_{test} from the torque and power-versus-speed maps, generated according to § 1065.510, as follows:

(1) For constant speed engines mapped using the methods in § 1065.510(d)(5)(i) or (ii), determine T_{test} as follows:

(i) Determine maximum power, P_{max} , from the engine map generated according to § 1065.510 and calculate the value for power equal to 98% of P_{max} .

(ii) Determine the lowest and highest engine speeds corresponding to 98% of P_{max} , using linear interpolation, and no extrapolation, as appropriate.

(iii) Determine the engine speed corresponding to maximum power, f_{nPmax} , by calculating the average of the two speed values from paragraph (a)(1)(ii) of this section. If there is only

one speed where power is equal to 98% of P_{max} , take f_{nPmax} as the speed at which P_{max} occurs.

(iv) Transform the map into a normalized power-versus-speed map by dividing power terms by P_{max} and dividing speed terms by f_{nPmax} . Use Eq. 1065.610-1 to calculate a quantity representing the sum of squares from the normalized map.

(v) Determine the maximum value for the sum of the squares from the map and multiply that value by 0.98.

(vi) Determine the lowest and highest engine speeds corresponding to the value calculated in paragraph (a)(1)(v) of this section, using linear interpolation as appropriate. Calculate f_{ntest} as the average of these two speed values. If there is only one speed corresponding to the value calculated in paragraph (a)(1)(v) of this section, take f_{ntest} as the speed where the maximum of the sum of the squares occurs.

(vii) The measured T_{test} is the mapped torque at f_{ntest} .

(2) For constant-speed engines using the two-point mapping method in § 1065.510(d)(5)(iii), you may follow paragraph (a)(1) of this section to determine the measured T_{test} , or you may use the measured torque of the second point as the measured T_{test} directly.

(3) Transform normalized torques to reference torques according to paragraph (d) of this section by using the measured maximum test torque determined according to paragraph (b)(1) of this section—or use your declared maximum test torque, as allowed in § 1065.510.

(c) * * *

(1) *% speed.* If your normalized duty cycle specifies % speed values, use your warm idle speed and your maximum test speed to transform the duty cycle, as follows:

$$f_{nref} = \% speed \cdot (f_{ntest} - f_{nidle}) + f_{nidle}$$

Eq. 1065.610-3

Example:

$\% speed = 85\% = 0.85$
 $f_{ntest} = 2364$ r/min
 $f_{nidle} = 650$ r/min
 $f_{nref} = 0.85 \cdot (2364 - 650) + 650$
 $f_{nref} = 2107$ r/min

(2) *A, B, and C speeds.* If your normalized duty cycle specifies speeds as A, B, or C values, use your power-versus-speed curve to determine the

lowest speed below maximum power at which 50% of maximum power occurs. Denote this value as n_{lo} . Take n_{lo} to be warm idle speed if all power points at speeds below the maximum power speed are higher than 50% of maximum power. Also determine the highest speed above maximum power at which 70% of maximum power occurs. Denote

this value as n_{hi} . If all power points at speeds above the maximum power speed are higher than 70% of maximum power, take n_{hi} to be the declared maximum safe engine speed or the declared maximum representative engine speed, whichever is lower. Use n_{hi} and n_{lo} to calculate reference values for A, B, or C speeds as follows:

$$f_{nrefA} = 0.25 \cdot (n_{hi} - n_{lo}) + n_{lo}$$

Eq. 1065.610-4

$$f_{nrefB} = 0.50 \cdot (n_{hi} - n_{lo}) + n_{lo}$$

Eq. 1065.610-5

$$f_{\text{nrefC}} = 0.75 \cdot (n_{\text{hi}} - n_{\text{lo}}) + n_{\text{lo}}$$

Eq. 1065.610-6

Example:

$$n_{\text{lo}} = 1005 \text{ r/min}$$

$$n_{\text{hi}} = 2385 \text{ r/min}$$

$$f_{\text{nrefA}} = 0.25 \cdot (2385 - 1005) + 1005$$

$$f_{\text{nrefB}} = 0.50 \cdot (2385 - 1005) + 1005$$

$$f_{\text{nrefC}} = 0.75 \cdot (2385 - 1005) + 1005$$

$$f_{\text{nrefA}} = 1350 \text{ r/min}$$

$$f_{\text{nrefB}} = 1695 \text{ r/min}$$

$$f_{\text{nrefC}} = 2040 \text{ r/min}$$

* * * *

■ 264. Section 1065.640 is amended by revising paragraphs (a), (b), (c), (d), and (e)(3) to read as follows:

§ 1065.640 Flow meter calibration calculations.

* * * *

(a) *Reference meter conversions.* The calibration equations in this section use molar flow rate, \dot{n}_{ref} , as a reference quantity. If your reference meter outputs a flow rate in a different quantity, such

as standard volume rate, \dot{V}_{stdref} , actual volume rate, \dot{V}_{actref} , or mass rate, \dot{m}_{ref} , convert your reference meter output to a molar flow rate using the following equations, noting that while values for volume rate, mass rate, pressure, temperature, and molar mass may change during an emission test, you should ensure that they are as constant as practical for each individual set point during a flow meter calibration:

$$\dot{n}_{\text{ref}} = \frac{\dot{V}_{\text{stdref}} \cdot p_{\text{std}}}{T_{\text{std}} \cdot R} = \frac{\dot{V}_{\text{actref}} \cdot p_{\text{act}}}{T_{\text{act}} \cdot R} = \frac{\dot{m}_{\text{ref}}}{M_{\text{mix}}}$$

Eq. 1065.640-1

Where:

\dot{n}_{ref} = reference molar flow rate.

\dot{V}_{stdref} = reference volume flow rate, corrected to a standard pressure and a standard temperature.

\dot{V}_{actref} = reference volume flow rate at the actual pressure and temperature of the flow rate.

\dot{m}_{ref} = reference mass flow.

p_{std} = standard pressure.

p_{act} = actual pressure of the flow rate.

T_{std} = standard temperature.

T_{act} = actual temperature of the flow rate.

R = molar gas constant.

M_{mix} = molar mass of the flow rate.

Example 1:

$$\dot{n}_{\text{ref}} = \frac{0.471948 \cdot 101325}{293.15 \cdot 8.314472}$$

$$\dot{n}_{\text{ref}} = 19.619 \text{ mol/s}$$

Example 2:

$$\dot{m}_{\text{ref}} = 17.2683 \text{ kg/min} = 287.805 \text{ g/s}$$

$$M_{\text{mix}} = 28.7805 \text{ g/mol}$$

$$\dot{n}_{\text{ref}} = \frac{287.805}{28.7805}$$

$$\dot{n}_{\text{ref}} = 10.0000 \text{ mol/s}$$

(b) *PDP calibration calculations.* Perform the following steps to calibrate a PDP flow meter:

(1) Calculate PDP volume pumped per revolution, V_{rev} , for each restrictor position from the mean values determined in § 1065.340 as follows:

$$V_{\text{rev}} = \frac{\bar{\dot{n}}_{\text{ref}} \cdot R \cdot \bar{T}_{\text{in}}}{\bar{p}_{\text{in}} \cdot \bar{f}_{\text{nPDP}}}$$

Eq. 1065.640-2

Where:

\dot{n}_{ref} = mean reference molar flow rate.

R = molar gas constant.

\bar{T}_{in} = mean temperature at the PDP inlet.

\bar{p}_{in} = mean static absolute pressure at the PDP inlet.

\bar{f}_{nPDP} = mean PDP speed.

Example:

$$\dot{n}_{\text{ref}} = 25.096 \text{ mol/s}$$

$$R = 8.314472 \text{ J/(mol}\cdot\text{K)} = 8.314472 \text{ (m}^2\cdot\text{kg)/(s}^2\cdot\text{mol}\cdot\text{K)}$$

$$\bar{T}_{\text{in}} = 299.5 \text{ K}$$

$$\bar{p}_{\text{in}} = 98.290 \text{ kPa} = 98290 \text{ Pa} = 98290 \text{ kg/(m}\cdot\text{s}^2)$$

$$\bar{f}_{\text{nPDP}} = 1205.1 \text{ r/min} = 20.085 \text{ r/s}$$

$$V_{\text{rev}} = \frac{25.096 \cdot 8.314472 \cdot 299.5}{98290 \cdot 20.085}$$

$$V_{\text{rev}} = 0.03166 \text{ m}^3/\text{r}$$

(2) Calculate a PDP slip correction factor, K_s , for each restrictor position

from the mean values determined in § 1065.340 as follows:

$$K_s = \frac{1}{\bar{f}_{\text{nPDP}}} \cdot \sqrt{\frac{\bar{P}_{\text{out}} - \bar{P}_{\text{in}}}{\bar{P}_{\text{out}}}}$$

Eq. 1065.640-3

Where:

\bar{f}_{nPDP} = mean PDP speed.

\bar{P}_{out} = mean static absolute pressure at the PDP outlet.

\bar{P}_{in} = mean static absolute pressure at the PDP inlet.

Example:
 $\bar{f}_{\text{nPDP}} = 1205.1 \text{ r/min} = 20.085 \text{ r/s}$

$\bar{P}_{\text{out}} = 100.103 \text{ kPa}$

$\bar{P}_{\text{in}} = 98.290 \text{ kPa}$

$$K_s = \frac{1}{20.085} \cdot \sqrt{\frac{100.103 - 98.290}{100.103}}$$

$$K_s = 0.006700 \text{ s/r}$$

(3) Perform a least-squares regression of V_{rev} , versus K_s , by calculating slope,

a_1 , and intercept, a_0 , as described in § 1065.602.

(4) Repeat the procedure in paragraphs (b)(1) through (3) of this

section for every speed that you run your PDP.

(5) The following table illustrates a range of typical values for different PDP speeds:

TABLE 1 OF § 1065.640—EXAMPLE OF PDP CALIBRATION DATA

\bar{f}_{nPDP} (revolution/s)	a_1 (m ³ /s)	a_0 (m ³ /revolution)
12.6	0.841	0.056
16.5	0.831	−0.013
20.9	0.809	0.028
23.4	0.788	−0.061

(6) For each speed at which you operate the PDP, use the appropriate regression equation from this paragraph (b) to calculate flow rate during emission testing as described in § 1065.642.

(c) *Venturi governing equations and permissible assumptions.* This section describes the governing equations and permissible assumptions for calibrating a venturi and calculating flow using a venturi. Because a subsonic venturi (SSV) and a critical-flow venturi (CFV) both operate similarly, their governing equations are nearly the same, except

for the equation describing their pressure ratio, r (i.e., r_{SSV} versus r_{CFV}). These governing equations assume one-dimensional isentropic inviscid flow of an ideal gas. Paragraph (c)(5) of this section describes other assumptions that may apply. If good engineering judgment dictates that you account for gas compressibility, you may either use an appropriate equation of state to determine values of Z as a function of measured pressure and temperature, or you may develop your own calibration equations based on good engineering judgment. Note that the equation for the

flow coefficient, C_f , is based on the ideal gas assumption that the isentropic exponent, γ , is equal to the ratio of specific heats, C_p/C_v . If good engineering judgment dictates using a real gas isentropic exponent, you may either use an appropriate equation of state to determine values of γ as a function of measured pressures and temperatures, or you may develop your own calibration equations based on good engineering judgment.

(1) Calculate molar flow rate, \dot{n} , as follows:

$$\dot{n} = C_d \cdot C_f \cdot \frac{A_t \cdot P_{\text{in}}}{\sqrt{Z \cdot M_{\text{mix}} \cdot R \cdot T_{\text{in}}}}$$

Eq. 1065.640-4

Where:

C_d = discharge coefficient, as determined in paragraph (c)(2) of this section.

C_f = flow coefficient, as determined in paragraph (c)(3) of this section.

A_t = venturi throat cross-sectional area.

p_{in} = venturi inlet absolute static pressure.

Z = compressibility factor.

M_{mix} = molar mass of gas mixture.

R = molar gas constant.

T_{in} = venturi inlet absolute temperature.

(2) Using the data collected in § 1065.340, calculate C_d for each flow rate using the following equation:

$$C_d = \dot{n}_{ref} \cdot \frac{\sqrt{Z \cdot M_{mix} \cdot R \cdot T_{in}}}{C_f \cdot A_t \cdot p_{in}}$$

Eq. 1065.640-5

Where:

\dot{n}_{ref} = a reference molar flow rate.

(3) Determine C_f using one of the following methods:

(i) For CFV flow meters only, determine C_{fCFV} from the following table based on your values for β and γ , using linear interpolation to find intermediate values:

TABLE 2 OF § 1065.640— C_{fCFV}
VERSUS β AND γ FOR CFV FLOW
METERS

C_{fCFV}		
β	$\gamma_{exh} = 385$	$\gamma_{dexh} = \gamma_{air} = 399$
0.000	0.6822	0.6846

TABLE 2 OF § 1065.640— C_{fCFV}
VERSUS β AND γ FOR CFV FLOW
METERS—Continued

C_{fCFV}		
β	$\gamma_{exh} = 385$	$\gamma_{dexh} = \gamma_{air} = 399$
0.400	0.6857	0.6881
0.500	0.6910	0.6934
0.550	0.6953	0.6977
0.600	0.7011	0.7036
0.625	0.7047	0.7072
0.650	0.7089	0.7114

0.700	0.7193	0.7219
0.720	0.7245	0.7271
0.740	0.7303	0.7329
0.760	0.7368	0.7395
0.770	0.7404	0.7431

TABLE 2 OF § 1065.640— C_{fCFV}
VERSUS β AND γ FOR CFV FLOW
METERS—Continued

C_{fCFV}		
β	$\gamma_{exh} = 385$	$\gamma_{dexh} = \gamma_{air} = 399$
0.780	0.7442	0.7470
0.790	0.7483	0.7511
0.800	0.7527	0.7555
0.810	0.7573	0.7602
0.820	0.7624	0.7652
0.830	0.7677	0.7707
0.840	0.7735	0.7765
0.850	0.7798	0.7828

(ii) For any CFV or SSV flow meter, you may use the following equation to calculate C_f for each flow rate:

$$C_f = \left[\frac{2 \cdot \gamma \cdot \left(r^{\frac{\gamma-1}{\gamma}} - 1 \right)}{(\gamma - 1) \cdot \left(\beta^4 - r^{\frac{2}{\gamma}} \right)} \right]^{\frac{1}{2}}$$

Eq. 1065.640-6

Where:

γ = isentropic exponent. For an ideal gas, this is the ratio of specific heats of the gas mixture, C_p/C_v .

r = pressure ratio, as determined in paragraph (c)(4) of this section.

β = ratio of venturi throat to inlet diameters.

(4) Calculate r as follows:

(i) For SSV systems only, calculate r_{SSV} using the following equation:

$$r_{SSV} = 1 - \frac{\Delta p_{SSV}}{p_{in}}$$

Eq. 1065.640-7

Where:

Δp_{SSV} = Differential static pressure; venturi inlet minus venturi throat.

(ii) For CFV systems only, calculate r_{CFV} iteratively using the following equation:

$$r_{\text{CFV}}^{\frac{1-\gamma}{\gamma}} + \left(\frac{\gamma-1}{2} \right) \cdot \beta^4 \cdot r_{\text{CFV}}^{\frac{2}{\gamma}} = \frac{\gamma+1}{2}$$

Eq. 1065.640-8

(5) You may apply any of the following simplifying assumptions or develop other values as appropriate for your test configuration, consistent with good engineering judgment:

(i) For raw exhaust, diluted exhaust, and dilution air, you may assume that

the gas mixture behaves as an ideal gas: $Z = 1$.

(ii) For raw exhaust, you may assume $\gamma = 1.385$.

(iii) For diluted exhaust and dilution air, you may assume $\gamma = 1.399$.

(iv) For diluted exhaust and dilution air, you may assume the molar mass of the mixture, M_{mix} , is a function only of the amount of water in the dilution air or calibration air, as follows:

$$M_{\text{mix}} = M_{\text{air}} \cdot (1 - x_{\text{H}_2\text{O}}) + M_{\text{H}_2\text{O}} \cdot x_{\text{H}_2\text{O}}$$

Eq. 1065.640-9

Where:

M_{air} = molar mass of dry air.

$x_{\text{H}_2\text{O}}$ = amount of H_2O in the dilution air or calibration air, determined as described in § 1065.645.

$M_{\text{H}_2\text{O}}$ = molar mass of water.

Example:

$M_{\text{air}} = 28.96559 \text{ g/mol}$

$x_{\text{H}_2\text{O}} = 0.0169 \text{ mol/mol}$

$M_{\text{H}_2\text{O}} = 18.01528 \text{ g/mol}$

$$M_{\text{mix}} = 28.96559 \cdot (1 - 0.0169) + 18.01528 \cdot 0.0169$$

$$M_{\text{mix}} = 28.7805 \text{ g/mol}$$

(v) For diluted exhaust and dilution air, you may assume a constant molar mass of the mixture, M_{mix} , for all calibration and all testing as long as your assumed molar mass differs no more than $\pm 1\%$ from the estimated minimum and maximum molar mass during calibration and testing.

You may assume this, using good engineering judgment, if you sufficiently control the amount of water in calibration air and in dilution air or if you remove sufficient water from both calibration air and dilution air. The following table gives examples of permissible ranges of dilution air dewpoint versus calibration air dewpoint:

TABLE 3 OF § 1065.640—EXAMPLES OF DILUTION AIR AND CALIBRATION AIR DEWPOINTS AT WHICH YOU MAY ASSUME A CONSTANT M_{mix}

If calibration T_{dew} (°C) is . . .	assume the following constant M_{mix} (g/mol) . . .	for the following ranges of T_{dew} (°C) during emission tests ^a
dry	28.96559	dry to 18
0	28.89263	dry to 21
5	28.86148	dry to 22
10	28.81911	dry to 24
15	28.76224	dry to 26
20	28.68685	−8 to 28
25	28.58806	12 to 31
30	28.46005	23 to 34

^a Range valid for all calibration and emission testing over the atmospheric pressure range (80.000 to 103.325) kPa.

(6) The following example illustrates the use of the governing equations to calculate C_d of an SSV flow meter at one reference flow meter value. Note that calculating C_d for a CFV flow meter would be similar, except that C_f would be determined from Table 2 of this section or calculated iteratively using

values of β and γ as described in paragraph (c)(2) of this section.

Example:

$$\dot{n}_{\text{ref}} = 57.625 \text{ mol/s}$$

$$Z = 1$$

$$M_{\text{mix}} = 28.7805 \text{ g/mol} = 0.0287805 \text{ kg/mol}$$

$$R = 8.314472 \text{ J/(mol} \cdot \text{K)} = 8.314472 \text{ (m}^2 \cdot \text{kg)/(s}^2 \cdot \text{mol} \cdot \text{K)}$$

$$T_{\text{in}} = 298.15 \text{ K}$$

$$A_t = 0.01824 \text{ m}^2$$

$$p_{\text{in}} = 99.132 \text{ kPa} = 99132.0 \text{ Pa} = 99132 \text{ kg/(m} \cdot \text{s}^2)$$

$$\gamma = 1.399$$

$$\beta = 0.8$$

$$\Delta p = 2.312 \text{ kPa}$$

$$r_{\text{SSV}} = 1 - \frac{2.312}{99.132} = 0.977$$

$$C_f = \left[\frac{2 \cdot 1.399 \cdot \left(0.977^{\frac{1.399-1}{1.399}} - 1 \right)}{(1.399-1) \cdot \left(0.8^4 - 0.977^{\frac{-2}{1.399}} \right)} \right]^{\frac{1}{2}}$$

$$C_f = 0.274$$

$$C_d = 57.625 \cdot \frac{\sqrt{1 \cdot 0.0287805 \cdot 8.314472 \cdot 298.15}}{0.274 \cdot 0.01824 \cdot 99132.0}$$

$$C_d = 0.982$$

(d) *SSV calibration.* Perform the following steps to calibrate an SSV flow meter:

(1) Calculate the Reynolds number, $Re^{\#}$, for each reference molar flow rate,

\dot{n}_{ref} , using the throat diameter of the venturi, d_t . Because the dynamic viscosity, μ , is needed to compute $Re^{\#}$, you may use your own fluid viscosity model to determine μ for your calibration gas (usually air), using good

engineering judgment. Alternatively, you may use the Sutherland three-coefficient viscosity model to approximate μ , as shown in the following sample calculation for $Re^{\#}$:

$$Re^{\#} = \frac{4 \cdot M_{\text{mix}} \cdot \dot{n}_{\text{ref}}}{\pi \cdot d_t \cdot \mu}$$

Eq. 1065.640-10

Where, using the Sutherland three-coefficient viscosity model:

$$\mu = \mu_0 \cdot \left(\frac{T_{\text{in}}}{T_0} \right)^{\frac{3}{2}} \cdot \left(\frac{T_0 + S}{T_{\text{in}} + S} \right)$$

Eq. 1065.640-11

Where:

μ_0 = Sutherland reference viscosity.

T_0 = Sutherland reference temperature.

S = Sutherland constant.

TABLE 4 OF § 1065.640—SUTHERLAND THREE-COEFFICIENT VISCOSITY MODEL PARAMETERS

Gas ^a	μ_0	T_0	S	Temperature range within $\pm 2\%$ error ^b	Pressure limit ^b
	kg/(m·s)	K	K	K	kPa
Air	$1.716 \cdot 10^{-5}$	273	111	170 to 1900	≤ 1800
CO ₂	$1.370 \cdot 10^{-5}$	273	222	190 to 1700	≤ 3600
H ₂	$1.12 \cdot 10^{-5}$	350	1064	360 to 1500	≤ 10000
O ₂	$1.919 \cdot 10^{-5}$	273	139	190 to 2000	≤ 2500
N ₂	$1.663 \cdot 10^{-5}$	273	107	100 to 1500	≤ 1600

^a Use tabulated parameters only for the pure gases, as listed. Do not combine parameters in calculations to calculate viscosities of gas mixtures.

^b The model results are valid only for ambient conditions in the specified ranges.

Example:

$$S = 111 \text{ K}$$

$$\mu_0 = 1.716 \cdot 10^{-5} \text{ kg/(m·s)}$$

$$T_0 = 273 \text{ K}$$

$$\mu = 1.716 \cdot 10^{-5} \cdot \left(\frac{298.15}{273} \right)^{\frac{3}{2}} \cdot \left(\frac{273 + 111}{298.15 + 111} \right)$$

$$\mu = 1.838 \cdot 10^{-5} \text{ kg/(m}\cdot\text{s)}$$

$$M_{\text{mix}} = 28.7805 \text{ g/mol}$$

$$\dot{n}_{\text{ref}} = 57.625 \text{ mol/s}$$

$$d_t = 152.4 \text{ mm} = 0.1524 \text{ m}$$

$$T_{\text{in}} = 298.15 \text{ K}$$

$$Re^{\#} = \frac{4 \cdot 28.7805 \cdot 57.625}{3.14159 \cdot 0.1524 \cdot 1.838 \cdot 10^{-5}}$$

$$Re^{\#} = 7.538 \cdot 10^8$$

(2) Create an equation for C_d as a function of $Re^{\#}$, using paired values of

the two quantities. The equation may involve any mathematical expression, including a polynomial or a power series. The following equation is an

example of a commonly used mathematical expression for relating C_d and $Re^{\#}$:

$$C_d = a_0 - a_1 \cdot \sqrt{\frac{10^6}{Re^{\#}}}$$

Eq. 1065.640-12

(3) Perform a least-squares regression analysis to determine the best-fit coefficients for the equation and calculate SEE as described in § 1065.602.

(4) If the equation meets the criterion of $SEE \leq 0.5\% \cdot C_{d\text{max}}$, you may use the equation for the corresponding range of $Re^{\#}$, as described in § 1065.642.

(5) If the equation does not meet the specified statistical criterion, you may use good engineering judgment to omit calibration data points; however you must use at least seven calibration data

points to demonstrate that you meet the criterion. For example, this may involve narrowing the range of flow rates for a better curve fit.

(6) Take corrective action if the equation does not meet the specified statistical criterion even after omitting calibration data points. For example, select another mathematical expression for the C_d versus $Re^{\#}$ equation, check for leaks, or repeat the calibration process. If you must repeat the calibration process, we recommend applying tighter tolerances to measurements and

allowing more time for flows to stabilize.

(7) Once you have an equation that meets the specified statistical criterion, you may use the equation only for the corresponding range of $Re^{\#}$.

(e) * * *

(3) If the standard deviation of all the C_d values is less than or equal to 0.3% of the mean C_d , use the mean C_d in Eq. 1065.642-4, and use the CFV only up to the highest venturi pressure ratio, r , measured during calibration using the following equation:

$$r = 1 - \frac{\Delta p_{\text{CFV}}}{P_{\text{in}}}$$

Eq. 1065.640-13

Where:

Δp_{CFV} = Differential static pressure; venturi inlet minus venturi outlet.

* * * * *

■ 265. Section 1065.642 is revised to read as follows:

§ 1065.642 PDP, SSV, and CFV molar flow rate calculations.

This section describes the equations for calculating molar flow rates from various flow meters. After you calibrate a flow meter according to § 1065.640, use the calculations described in this section to calculate flow during an emission test.

(a) *PDP molar flow rate.* (1) Based on the speed at which you operate the PDP for a test interval, select the corresponding slope, a_1 , and intercept, a_0 , as calculated in § 1065.640, to calculate PDP molar flow rate, as follows:

$$\dot{n} = f_{\text{nPDP}} \cdot \frac{V_{\text{rev}} \cdot P_{\text{in}}}{R \cdot T_{\text{in}}}$$

Eq. 1065.642-1

Where:

f_{nPDP} = pump speed.

V_{rev} = PDP volume pumped per revolution, as determined in paragraph (a)(2) of this section.

p_{in} = static absolute pressure at the PDP inlet.

R = molar gas constant.

T_{in} = absolute temperature at the PDP inlet.

(2) Calculate V_{rev} using the following equation:

$$V_{\text{rev}} = \frac{a_1}{f_{\text{nPDP}}} \cdot \sqrt{\frac{p_{\text{out}} - p_{\text{in}}}{p_{\text{out}}}} + a_0$$

Eq. 1065.642-2

p_{out} = static absolute pressure at the PDP outlet.

Example:

$a_1 = 0.8405 \text{ (m}^3/\text{s)}$

$f_{\text{nPDP}} = 12.58 \text{ r/s}$

$P_{\text{out}} = 99.950 \text{ kPa}$

$P_{\text{in}} = 98.575 \text{ kPa} = 98575 \text{ Pa} = 98575 \text{ kg/}$
 $(\text{m} \cdot \text{s}^2)$

$a_0 = 0.056 \text{ (m}^3/\text{r)}$

$R = 8.314472 \text{ J/(mol} \cdot \text{K)} = 8.314472 \text{ (m}^2 \cdot \text{kg)/}$
 $(\text{s}^2 \cdot \text{mol} \cdot \text{K)}$

$T_{\text{in}} = 323.5 \text{ K}$

$$V_{\text{rev}} = \frac{0.8405}{12.58} \cdot \sqrt{\frac{99.950 - 98.575}{99.950}} + 0.056$$

$$\dot{n} = 12.58 \cdot \frac{98575 \cdot 0.06383}{8.314472 \cdot 323.5}$$

$\dot{n} = 29.428 \text{ mol/s}$

(b) *SSV molar flow rate.* Calculate SSV molar flow rate, \dot{n} , as follows:

$$\dot{n} = C_d \cdot C_f \cdot \frac{A_t \cdot p_{\text{in}}}{\sqrt{Z \cdot M_{\text{mix}} \cdot R \cdot T_{\text{in}}}}$$

Eq. 1065.642-3

Where:

C_d = discharge coefficient, as determined based on the C_d versus $Re^{\#}$ equation in § 1065.640(d)(2).

C_f = flow coefficient, as determined in § 1065.640(c)(2)(ii).

A_t = venturi throat cross-sectional area.

P_{in} = static absolute pressure at the venturi inlet.

Z = compressibility factor.

M_{mix} = molar mass of gas mixture.

R = molar gas constant.

T_{in} = absolute temperature at the venturi inlet.

Example:

$A_t = 0.01824 \text{ m}^2$

$P_{\text{in}} = 99.132 \text{ kPa} = 99132 \text{ Pa} = 99132 \text{ kg/}$
 $(\text{m} \cdot \text{s}^2)$

$Z = 1$

$M_{\text{mix}} = 28.7805 \text{ g/mol} = 0.0287805 \text{ kg/mol}$

$R = 8.314472 \text{ J/(mol} \cdot \text{K)} = 8.314472 \text{ (m}^2 \cdot \text{kg)/}$
 $(\text{s}^2 \cdot \text{mol} \cdot \text{K)}$

$T_{\text{in}} = 298.15 \text{ K}$

$Re^{\#} = 7.232 \cdot 10^5$

$\gamma = 1.399$

$\beta = 0.8$

$\Delta p = 2.312 \text{ kPa}$

Using Eq. 1065.640-7, $r_{\text{ssv}} = 0.997$

Using Eq. 1065.640-6, $C_f = 0.274$

Using Eq. 1065.640-5, $C_d = 0.990$

$$\dot{n} = 0.990 \cdot 0.274 \cdot \frac{0.01824 \cdot 99132}{\sqrt{1 \cdot 0.0287805 \cdot 8.314472 \cdot 298.15}}$$

$\dot{n} = 58.173 \text{ mol/s}$

(c) *CFV molar flow rate.* If you use multiple venturis and you calibrate each venturi independently to determine a separate discharge coefficient, C_d (or calibration coefficient, K_v), for each venturi, calculate the individual molar flow rates through each venturi and sum

all their flow rates to determine CFV flow rate, \dot{n} . If you use multiple venturis and you calibrated venturis in combination, calculate \dot{n} using the sum of the active venturi throat areas as A_t , the square root of the sum of the squares of the active venturi throat diameters as d_t , and the ratio of the venturi throat to inlet diameters as the ratio of the square

root of the sum of the active venturi throat diameters (d_t) to the diameter of the common entrance to all the venturis (D).

(1) To calculate \dot{n} through one venturi or one combination of venturis, use its respective mean C_d and other constants you determined according to § 1065.640 and calculate \dot{n} as follows:

$$\dot{n} = C_d \cdot C_f \cdot \frac{A_t \cdot p_{in}}{\sqrt{Z \cdot M_{mix} \cdot R \cdot T_{in}}}$$

Eq. 1065.642-4

Example: $C_d = 0.985$ $C_f = 0.7219$ $A_t = 0.00456 \text{ m}^2$ $p_{in} = 98.836 \text{ kPa} = 98836 \text{ Pa} = 98836 \text{ kg/}$
(m·s²) $Z = 1$ $M_{mix} = 28.7805 \text{ g/mol} = 0.0287805 \text{ kg/mol}$ $R = 8.314472 \text{ J/(mol·K)} = 8.314472 \text{ (m}^2\text{·kg)/}$
(s²·mol·K) $T_{in} = 378.15 \text{ K}$

$$\dot{n} = 0.985 \cdot 0.7219 \cdot \frac{0.00456 \cdot 98836}{\sqrt{1 \cdot 0.0287805 \cdot 8.314472 \cdot 378.15}}$$

 $\dot{n} = 33.690 \text{ mol/s}$

(2) To calculate the molar flow rate through one venturi or a combination of venturis, you may use its respective

mean, K_v , and other constants you determined according to § 1065.640 and calculate its molar flow rate \dot{n} during an emission test. Note that if you follow the permissible ranges of dilution air

dewpoint versus calibration air dewpoint in Table 3 of § 1065.640, you may set $M_{mix-cal}$ and M_{mix} equal to 1. Calculate \dot{n} as follows:

$$\dot{n} = \frac{K_v \cdot p_{in}}{\sqrt{T_{in}}} \cdot \frac{p_{std}}{T_{std} \cdot R} \cdot \frac{\sqrt{M_{mix-cal}}}{\sqrt{M_{mix}}}$$

Eq. 1065.642-5

Where:

$$K_v = \frac{V_{stdref} \cdot \sqrt{T_{in-cal}}}{p_{in-cal}}$$

Eq. 1065.642-6

V_{stdref} = volume flow rate of the standard at reference conditions of 293.15 K and 101.325 kPa.

T_{in-cal} = venturi inlet temperature during calibration.

p_{in-cal} = venturi inlet pressure during calibration.

$M_{mix-cal}$ = molar mass of gas mixture used during calibration.

M_{mix} = molar mass of gas mixture during the emission test calculated using Eq. 1065.640-9.

Example: $V_{stdref} = 0.4895 \text{ m}^3$ $T_{in-cal} = 302.52 \text{ K}$ $p_{in-cal} = 99.654 \text{ kPa} = 99654 \text{ Pa} = 99654 \text{ kg/}$
(m·s²) $p_{in} = 98.836 \text{ kPa} = 98836 \text{ Pa} = 98836 \text{ kg/}$
(m·s²) $p_{std} = 101.325 \text{ kPa} = 101325 \text{ Pa} = 101325 \text{ kg/}$
(m·s²) $M_{mix-cal} = 28.9656 \text{ g/mol} = 0.0289656 \text{ kg/mol}$ $M_{mix} = 28.7805 \text{ g/mol} = 0.0287805 \text{ kg/mol}$ $T_{in} = 353.15 \text{ K}$ $T_{std} = 293.15 \text{ K}$ $R = 8.314472 \text{ J/(mol·K)} = 8.314472 \text{ (m}^2\text{·kg)/}$
(s²·mol·K)

$$K_v = \frac{0.4895 \cdot \sqrt{302.52}}{99654} = 0.000074954 \text{ m}^4 \cdot \text{s} \cdot \text{K}^{0.5} / \text{kg}$$

$$\dot{n} = \frac{0.000074954 \cdot 98936}{\sqrt{353.15}} \cdot \frac{101325}{293.15 \cdot 8.314472} \cdot \frac{\sqrt{0.0289656}}{\sqrt{0.0287805}}$$

 $\dot{n} = 16.457 \text{ mol/s}$

■ 266. Section 1065.645 is amended by revising paragraphs (c) and (d) to read as follows:

§ 1065.645 Amount of water in an ideal gas.

* * * * *

(c) *Relative humidity.* If you measure humidity as a relative humidity, *RH*, determine the amount of water in an ideal gas, x_{H_2O} , as follows:

$$x_{\text{H}_2\text{O}} = \frac{RH \cdot p_{\text{H}_2\text{O}}}{p_{\text{abs}}}$$

Eq. 1065.645-4

Where:

 $x_{\text{H}_2\text{O}}$ = amount of water in an ideal gas. RH = relative humidity. $p_{\text{H}_2\text{O}}$ = water vapor pressure at 100% relative humidity at the location of your relative humidity measurement, $T_{\text{sat}} = T_{\text{amb}}$. p_{abs} = wet static absolute pressure at the location of your relative humidity measurement.

Example:

 $RH = 50.77\% = 0.5077$ $p_{\text{abs}} = 99.980 \text{ kPa}$ $T_{\text{sat}} = T_{\text{amb}} = 20 \text{ }^\circ\text{C}$

Using Eq. 1065.645-1,

 $p_{\text{H}_2\text{O}} = 2.3371 \text{ kPa}$ $x_{\text{H}_2\text{O}} = (0.5077 \cdot 2.3371)/99.980$ $x_{\text{H}_2\text{O}} = 0.011868 \text{ mol/mol}$

(d) *Dewpoint determination from relative humidity and dry bulb temperature.* This paragraph (d) describes how to calculate dewpoint temperature from relative humidity, RH . This is based on "ITS-90 Formulations for Vapor Pressure, Frostpoint

Temperature, Dewpoint Temperature, and Enhancement Factors in the Range -100 to $+100 \text{ }^\circ\text{C}$ " (Hardy, B., The Proceedings of the Third International Symposium on Humidity & Moisture, Teddington, London, England, April 1998). Calculate $p_{\text{H}_2\text{Osat}}$ as described in paragraph (a) of this section based on setting T_{sat} equal to T_{amb} . Calculate $p_{\text{H}_2\text{Oscaled}}$ by multiplying $p_{\text{H}_2\text{Osat}}$ by RH . Calculate the dewpoint, T_{dew} , from $p_{\text{H}_2\text{O}}$ using the following equation:

$$T_{\text{dew}} = \frac{2.0798233 \cdot 10^2 - 2.0156028 \cdot 10^1 \cdot \ln(p_{\text{H}_2\text{O}}) + 4.6778925 \cdot 10^{-1} \cdot \ln(p_{\text{H}_2\text{O}})^2 - 9.2288067 \cdot 10^{-6} \cdot \ln(p_{\text{H}_2\text{O}})^3}{1 - 1.3319669 \cdot 10^{-1} \cdot \ln(p_{\text{H}_2\text{O}}) + 5.6577518 \cdot 10^{-3} \cdot \ln(p_{\text{H}_2\text{O}})^2 - 7.5172865 \cdot 10^{-5} \cdot \ln(p_{\text{H}_2\text{O}})^3}$$

Eq. 1065.645-5

Where:

$\ln(p_{\text{H}_2\text{O}})$ = the natural log of $p_{\text{H}_2\text{Oscaled}}$, which is the water vapor pressure scaled to the relative humidity at the location of the

relative humidity measurement, $T_{\text{sat}} =$ T_{amb}

Example:

 $RH = 39.61\% = 0.3961$ $T_{\text{sat}} = T_{\text{amb}} = 20.00 \text{ }^\circ\text{C} = 293.15\text{K}$

Using Eq. 1065.645-1,

 $p_{\text{H}_2\text{Osat}} = 2.3371 \text{ kPa}$
 $p_{\text{H}_2\text{Oscaled}} = (0.3961 \cdot 2.3371) = 0.925717 \text{ kPa}$
 $= 925.717 \text{ Pa}$

$$T_{\text{dew}} = \frac{2.0798233 \cdot 10^2 - 2.0156028 \cdot 10^1 \cdot \ln(925.717) + 4.6778925 \cdot 10^{-1} \cdot \ln(925.717)^2 - 9.2288067 \cdot 10^{-6} \cdot \ln(925.717)^3}{1 - 1.3319669 \cdot 10^{-1} \cdot \ln(925.717) + 5.6577518 \cdot 10^{-3} \cdot \ln(925.717)^2 - 7.5172865 \cdot 10^{-5} \cdot \ln(925.717)^3}$$

■ 267. Section 1065.650 is amended by adding paragraph (c)(6) and revising paragraphs (e)(2), (f)(2), (f)(4), and (g)(2)(ii) to read as follows:

§ 1065.650 Emission calculations.

* * * * *

(c) * * *

(6) *Mass of NMNEHC.* If the test fuel has less than 0.010 mol/mol of ethane and you omit the NMNEHC calculations as described in § 1065.660(c)(1), take the corrected mass of NMNEHC to be 0.95 times the corrected mass of NMHC.

* * * * *

(e) * * *

(2) To calculate an engine's mean steady-state total power, \bar{P} , add the mean steady-state power from all the work paths described in § 1065.210 that cross the system boundary including electrical power, mechanical shaft

power, and fluid pumping power. For all work paths, except the engine's primary output shaft (crankshaft), the mean steady-state power over the test interval is the integration of the net work flow rate (power) out of the system boundary divided by the period of the test interval. When power flows into the system boundary, the power/work flow rate signal becomes negative; in this case, include these negative power/work rate values in the integration to calculate the mean power from that work path. Some work paths may result in a negative mean power. Include negative mean power values from any work path in the mean total power from the engine rather than setting these values to zero. The rest of this paragraph (e)(2) describes how to calculate the mean power from the engine's primary output shaft. Calculate \bar{P} using Eq.

1065.650-13, noting that \bar{P} , \bar{f}_n , and \bar{T} refer to mean power, mean rotational shaft frequency, and mean torque from the primary output shaft. Account for the power of simulated accessories according to § 1065.110 (reducing the mean primary output shaft power or torque by the accessory power or torque). Set the power to zero during actual motoring operation (negative feedback torques), unless the engine was connected to one or more energy storage devices. Examples of such energy storage devices include hybrid powertrain batteries and hydraulic accumulators, like the ones illustrated in Figure 1 of § 1065.210. Set the power to zero for modes with a zero reference load (0 N·m reference torque or 0 kW reference power). Include power during idle modes with simulated minimum torque or power.

$$\bar{P} = \bar{f}_n \cdot \bar{T}$$

Eq. 1065.650-13

* * * *

(f) * * *

(2) *Total work*. To calculate a value proportional to total work over a test interval, integrate a value that is proportional to power. Use information about the brake-specific fuel consumption of your engine, e_{fuel} , to convert a signal proportional to fuel flow rate to a signal proportional to

power. To determine a signal proportional to fuel flow rate, divide a signal that is proportional to the mass rate of carbon products by the fraction of carbon in your fuel, w_c . You may use a measured w_c or you may use default values for a given fuel as described in § 1065.655(e). Calculate the mass rate of carbon from the amount of carbon and water in the exhaust, which you

determine with a chemical balance of fuel, intake air, and exhaust as described in § 1065.655. In the chemical balance, you must use concentrations from the flow that generated the signal proportional to molar flow rate, \tilde{n} , in paragraph (e)(1) of this section. Calculate a value proportional to total work as follows:

$$W = \sum_{i=1}^N \tilde{P}_i \cdot \Delta t$$

Eq. 1065.650-15

Where:

$$\tilde{P}_i = \frac{\tilde{m}_{\text{fuel}i}}{e_{\text{fuel}}}$$

Eq. 1065.650-16

* * * *

(4)

Example: The following example shows how to calculate mass of emissions using proportional values:

 $N = 3000$ $f_{\text{record}} = 5 \text{ Hz}$ $e_{\text{fuel}} = 285 \text{ g/(kW}\cdot\text{hr)}$ $w_{\text{fuel}} = 0.869 \text{ g/g}$ $M_c = 12.0107 \text{ g/mol}$ $\tilde{n}_1 = 3.922 \text{ mol/s} = 14119.2 \text{ mol/hr}$ $\chi_{\text{Ccombdry1}} = 91.634 \text{ mmol/mol} = 0.091634 \text{ mol/mol}$ $\chi_{\text{H2Oexh1}} = 27.21 \text{ mmol/mol} = 0.02721 \text{ mol/mol}$ Using Eq. 1065.650-5,
 $\Delta t = 0.2 \text{ s}$

$$\tilde{W} = \frac{12.0107 \left(\frac{3.922 \cdot 0.091634}{1 + 0.02721} + \frac{\tilde{n}_2 \cdot x_{\text{Ccombdry2}}}{1 + x_{\text{H2Oexh2}}} + \dots + \frac{\tilde{n}_{3000} \cdot x_{\text{Ccombdry3000}}}{1 + x_{\text{H2Oexh3000}}} \right) \cdot 0.2}{285 \cdot 0.869}$$

 $\tilde{W} = 5.09 \text{ (kW}\cdot\text{hr)}$

(g) * * *

(2) * * *

(ii) Use the following equation if you calculate brake-specific emissions over

test intervals based on the ratio of mass rate to power as described in paragraph (b)(2) of this section:

$$e_{\text{composite}} = \frac{\sum_{i=1}^N WF_i \cdot \bar{m}_i}{\sum_{i=1}^N WF_i \cdot \bar{P}_i}$$

Eq. 1065.650-19

Where:

 i = test interval number. N = number of test intervals. WF = weighting factor for the test interval as defined in the standard-setting part.

\bar{m} = mean steady-state mass rate of emissions over the test interval as determined in paragraph (e) of this section.

\bar{P} = mean steady-state power over the test interval as described in paragraph (e) of this section.

Example:

$N = 2$

$WF_1 = 0.85$

$WF_2 = 0.15$

$\bar{m}_1 = 2.25842 \text{ g/hr}$

$\bar{m}_2 = 0.063443 \text{ g/hr}$

$\bar{P}_1 = 4.5383 \text{ kW}$

$\bar{P}_2 = 0.0 \text{ kW}$

$$e_{\text{NO}_x \text{ composite}} = \frac{(0.85 \cdot 2.25842) + (0.15 \cdot 0.063443)}{(0.85 \cdot 4.5383) + (0.15 \cdot 0.0)}$$

$e_{\text{NO}_x \text{ composite}} = 0.5001 \text{ g/kW-hr}$

* * * * *

■ 268. Section 1065.655 is amended as follows:

■ a. By revising paragraphs (a), (b), (c) introductory text, (c)(3), and (d).

■ b. By redesignating paragraphs (e) and (f) as paragraphs (f) and (g), respectively.

■ c. By adding a new paragraph (e).

■ d. By revising the newly redesignated paragraph (f)(3).

The revisions and additions read as follows:

§ 1065.655 Chemical balances of fuel, intake air, and exhaust.

(a) *General.* Chemical balances of fuel, intake air, and exhaust may be used to calculate flows, the amount of water in their flows, and the wet concentration of constituents in their flows. With one flow rate of either fuel, intake air, or exhaust, you may use chemical balances to determine the flows of the other two. For example, you may use chemical balances along with either intake air or fuel flow to determine raw exhaust flow. Note that chemical balance calculations require measured values for the flow rate of diesel exhaust fluid, if applicable.

(b) *Procedures that require chemical balances.* We require chemical balances when you determine the following:

(1) A value proportional to total work, \bar{W} , when you choose to determine brake-specific emissions as described in § 1065.650(f).

(2) Raw exhaust molar flow rate either from measured intake air molar flow rate or from fuel mass flow rate as described in paragraph (f) of this section.

(3) Raw exhaust molar flow rate from measured intake air molar flow rate and dilute exhaust molar flow rate, as described in paragraph (g) of this section.

(4) The amount of water in a raw or diluted exhaust flow, $\chi_{\text{H}_2\text{Oexh}}$, when you do not measure the amount of water to correct for the amount of water removed by a sampling system. Correct for removed water according to § 1065.659.

(5) The calculated total dilution air flow when you do not measure dilution

air flow to correct for background emissions as described in § 1065.667(c) and (d).

(c) *Chemical balance procedure.* The calculations for a chemical balance involve a system of equations that require iteration. We recommend using a computer to solve this system of equations. You must guess the initial values of up to three quantities: The amount of water in the measured flow, $\chi_{\text{H}_2\text{Oexh}}$, fraction of dilution air in diluted exhaust, $\chi_{\text{dil/exh}}$, and the amount of products on a C_1 basis per dry mole of dry measured flow, χ_{Ccombdry} . You may use time-weighted mean values of combustion air humidity and dilution air humidity in the chemical balance; as long as your combustion air and dilution air humidities remain within tolerances of $\pm 0.0025 \text{ mol/mol}$ of their respective mean values over the test interval. For each emission concentration, χ , and amount of water, $\chi_{\text{H}_2\text{Oexh}}$, you must determine their completely dry concentrations, χ_{dry} and $\chi_{\text{H}_2\text{Oexhdry}}$. You must also use your fuel mixture's atomic hydrogen-to-carbon ratio, α , oxygen-to-carbon ratio, β , sulfur-to-carbon ratio, γ , and nitrogen-to-carbon ratio, δ , you may optionally account for diesel exhaust fluid (or other fluids injected into the exhaust), if applicable. You may calculate α , β , γ , and δ based on measured fuel and diesel exhaust fluid composition or you may use default values as described in paragraph (e) of this section. Use the following steps to complete a chemical balance:

* * * * *

(3) Use the following symbols and subscripts in the equations for performing the chemical balance calculations in this paragraph (c):

$\chi_{\text{dil/exh}}$ = amount of dilution gas or excess air per mole of exhaust.

$\chi_{\text{H}_2\text{Oexh}}$ = amount of H_2O in exhaust per mole of exhaust.

χ_{Ccombdry} = amount of carbon from fuel in the exhaust per mole of dry exhaust.

$\chi_{\text{H}_2\text{dry}}$ = amount of H_2 in exhaust per amount of dry exhaust.

$K_{\text{H}_2\text{Ogas}}$ = water-gas reaction equilibrium coefficient. You may use 3.5 or calculate your own value using good engineering judgment.

$\chi_{\text{H}_2\text{Oexhdry}}$ = amount of H_2O in exhaust per dry mole of dry exhaust.

$\chi_{\text{prod/intdry}}$ = amount of dry stoichiometric products per dry mole of intake air.

$\chi_{\text{dil/exhdry}}$ = amount of dilution gas and/or excess air per mole of dry exhaust.

$\chi_{\text{int/exhdry}}$ = amount of intake air required to produce actual combustion products per mole of dry (raw or diluted) exhaust.

$\chi_{\text{raw/exhdry}}$ = amount of undiluted exhaust, without excess air, per mole of dry (raw or diluted) exhaust.

$\chi_{\text{O}_2\text{int}}$ = amount of intake air O_2 per mole of intake air.

$\chi_{\text{CO}_2\text{intdry}}$ = amount of intake air CO_2 per mole of dry intake air. You may use $\chi_{\text{CO}_2\text{intdry}} = 375 \text{ } \mu\text{mol/mol}$, but we recommend measuring the actual concentration in the intake air.

$\chi_{\text{H}_2\text{Ointdry}}$ = amount of intake air H_2O per mole of dry intake air.

$\chi_{\text{CO}_2\text{int}}$ = amount of intake air CO_2 per mole of intake air.

$\chi_{\text{CO}_2\text{dil}}$ = amount of dilution gas CO_2 per mole of dilution gas.

$\chi_{\text{CO}_2\text{dildry}}$ = amount of dilution gas CO_2 per mole of dry dilution gas. If you use air as diluent, you may use $\chi_{\text{CO}_2\text{dildry}} = 375 \text{ } \mu\text{mol/mol}$, but we recommend measuring the actual concentration in the intake air.

$\chi_{\text{H}_2\text{Odildry}}$ = amount of dilution gas H_2O per mole of dry dilution gas.

$\chi_{\text{H}_2\text{Odil}}$ = amount of dilution gas H_2O per mole of dilution gas.

$\chi_{[\text{emission}] \text{ meas}}$ = amount of measured emission in the sample at the respective gas analyzer.

$\chi_{[\text{emission}] \text{ dry}}$ = amount of emission per dry mole of dry sample.

$\chi_{\text{H}_2\text{O}[\text{emission}] \text{ meas}}$ = amount of H_2O in sample at emission-detection location. Measure or estimate these values according to § 1065.145(e)(2).

$\chi_{\text{H}_2\text{Oint}}$ = amount of H_2O in the intake air, based on a humidity measurement of intake air.

α = atomic hydrogen-to-carbon ratio of the fuel (or mixture of test fuels) and any injected fluids.

β = atomic oxygen-to-carbon ratio of the fuel (or mixture of test fuels) and any injected fluids.

γ = atomic sulfur-to-carbon ratio of the fuel (or mixture of test fuels) and any injected fluids.

δ = atomic nitrogen-to-carbon ratio of the fuel (or mixture of test fuels) and any injected fluids.

* * * * *

(d) *Carbon mass fraction of fuel.* Determine carbon mass fraction of fuel,

w_C , based on the fuel properties as determined in paragraph (e) of this section, accounting for diesel exhaust

fluid's contribution to α , β , γ , and δ , or that of any other fluid injected into the

exhaust, if applicable. Calculate w_C using the following equation:

$$w_C = \frac{1 \cdot M_C}{1 \cdot M_C + \alpha \cdot M_H + \beta \cdot M_O + \gamma \cdot M_S + \delta \cdot M_N}$$

Eq. 1065.655-19

Where:

w_C = carbon mass fraction of the fuel (or mixture of test fuels) and any injected fluids.

M_C = molar mass of carbon.

α = atomic hydrogen-to-carbon ratio of the fuel (or mixture of test fuels) and any injected fluids.

M_H = molar mass of hydrogen.

β = atomic oxygen-to-carbon ratio of the fuel (or mixture of test fuels) and any injected fluids.

M_O = molar mass of oxygen.

γ = atomic sulfur-to-carbon ratio of the fuel (or mixture of test fuels) and any injected fluids.

M_S = molar mass of sulfur.

δ = atomic nitrogen-to-carbon ratio of the fuel (or mixture of test fuels) and any injected fluids.

M_N = molar mass of nitrogen.

Example:

$\alpha = 1.8$

$\beta = 0.05$

$\gamma = 0.0003$

$\delta = 0.0001$

$M_C = 12.0107$

$M_H = 1.00794$

$M_O = 15.9994$

$M_S = 32.065$

$M_N = 14.0067$

$$w_C = \frac{1 \cdot 12.0107}{1 \cdot 12.0107 + 1.8 \cdot 1.00794 + 0.05 \cdot 15.9994 + 0.0003 \cdot 32.065 + 0.0001 \cdot 14.0067}$$

$w_C = 0.8206$

(e) *Fuel and diesel exhaust fluid composition.* Determine fuel and diesel exhaust fluid composition represented by α , β , γ , and δ as described in this paragraph (e). When using measured fuel or diesel exhaust fluid properties, you must determine values for α and β in all cases. If you determine compositions based on measured values and the default value listed in Table 1 of this section is zero, you may set γ and δ to zero; otherwise determine γ and δ (along with α and β) based on measured values. Determine elemental mass fractions and values for α , β , γ , and δ as follows:

(1) For liquid fuels, use the default values for α , β , γ , and δ in Table 1 of this section or determine mass fractions of liquid fuels for calculation of α , β , γ , and δ as follows:

(i) Determine the carbon and hydrogen mass fractions according to ASTM D5291 (incorporated by reference in § 1065.1010). When using ASTM D5291 to determine carbon and hydrogen mass fractions of gasoline (with or without blended ethanol), use good engineering judgment to adapt the method as appropriate. This may include consulting with the instrument manufacturer on how to test high-volatility fuels. Allow the weight of volatile fuel samples to stabilize for 20 minutes before starting the analysis; if the weight still drifts after 20 minutes, prepare a new sample. Retest the sample if the carbon, hydrogen, and oxygen mass fractions do not add up to a total

mass of $100 \pm 0.5\%$; if you do not measure oxygen, you may assume it has a zero concentration for this specification.

(ii) Determine oxygen mass fraction of gasoline (with or without blended ethanol) according to ASTM D5599 (incorporated by reference in § 1065.1010). For all other liquid fuels, determine the oxygen mass fraction using good engineering judgment.

(iii) Determine the nitrogen mass fraction according to ASTM D4629 or ASTM D5762 (incorporated by reference in § 1065.1010) for all liquid fuels. Select the correct method based on the expected nitrogen content.

(iv) Determine the sulfur mass fraction according to subpart H of this part.

(2) For gaseous fuels and diesel exhaust fluid, use the default values for α , β , γ , and δ in Table 1 of this section, or use good engineering judgment to determine those values based on measurement.

(3) For nonconstant fuel mixtures, you must account for the varying proportions of the different fuels. This generally applies for dual-fuel engines, but it also applies if diesel exhaust fluid is injected in a way that is not strictly proportional to fuel flow. Account for these varying concentrations either with a batch measurement that provides averaged values to represent the test interval, or by analyzing data from continuous mass rate measurements. Application of average values from a batch measurement generally applies to

situations where one fluid is a minor component of the total fuel mixture, for example dual-fuel engines with diesel pilot injection, where the diesel pilot fuel mass is less than 5% of the total fuel mass and diesel exhaust fluid injection; consistent with good engineering judgment.

(4) Calculate α , β , γ , and δ using the following equations:

$$\alpha = \frac{M_C}{M_H} \cdot \frac{\sum_{j=1}^M \dot{m}_j \cdot w_{Hj}}{\sum_{j=1}^M \dot{m}_j \cdot w_{Cj}}$$

Eq. 1065.655-20

$$\beta = \frac{M_C}{M_O} \cdot \frac{\sum_{j=1}^M \dot{m}_j \cdot w_{Oj}}{\sum_{j=1}^M \dot{m}_j \cdot w_{Cj}}$$

Eq. 1065.655-21

$$\gamma = \frac{M_C \cdot \sum_{j=1}^M \dot{m}_j \cdot w_{Sj}}{M_S \cdot \sum_{j=1}^M \dot{m}_j \cdot w_{Cj}}$$

Eq. 1065.655-22

$$\delta = \frac{M_C \cdot \sum_{j=1}^M \dot{m}_j \cdot w_{Nj}}{M_N \cdot \sum_{j=1}^M \dot{m}_j \cdot w_{Cj}}$$

Eq. 1065.655-23

Where:

M = total number of fuels and injected fluids over the duty cycle.

j = an indexing variable that represents one fuel or injected fluid, starting with j = 1.

\dot{m}_j = the mass flow rate of the fuel or any injected fluid j. For applications using a single fuel and no DEF fluid, set this value to 1. For batch measurements, divide the total mass of fuel over the test interval duration to determine a mass rate.

W_{Hj} = hydrogen mass fraction of fuel or any injected fluid j.

W_{Cj} = carbon mass fraction of fuel or any injected fluid j.

W_{Oj} = oxygen mass fraction of fuel or any injected fluid j.

W_{Sj} = sulfur mass fraction of fuel or any injected fluid j.

W_{Nj} = nitrogen mass fraction of fuel or any injected fluid j.

Example:

N = 1

j = 1

 $\dot{m}_j = 1$ $W_{Hj} = 0.1239$ $W_{Cj} = 0.8206$ $W_{Oj} = 0.0547$ $W_{Sj} = 0.00066$ $W_{Nj} = 0.000095$ $M_C = 12.0107$ $M_H = 1.00794$ $M_O = 15.9994$ $M_S = 32.065$ $M_N = 14.0067$

$$\alpha = \frac{12.0107 \cdot 1 \cdot 0.1239}{1.00794 \cdot 1 \cdot 0.8206}$$

$$\beta = \frac{12.0107 \cdot 1 \cdot 0.0547}{15.9994 \cdot 1 \cdot 0.8206}$$

$$\gamma = \frac{12.0107 \cdot 1 \cdot 0.00066}{32.065 \cdot 1 \cdot 0.8206}$$

$$\delta = \frac{12.0107 \cdot 1 \cdot 0.000095}{14.0067 \cdot 1 \cdot 0.8206}$$

 $\alpha = 1.799$ $\beta = 0.05004$ $\gamma = 0.0003012$ $\delta = 0.0001003$ TABLE 1 OF § 1065.655—DEFAULT VALUES OF α , β , γ , δ , AND W_C

Fuel or injected fluid	Atomic hydrogen, oxygen, sulfur, and nitrogen-to-carbon ratios $CH\alpha O\beta S\gamma N\delta$	Carbon mass fraction, W_C g/g
Gasoline	$CH_{1.85}O_0S_0N_0$	0.866
E10 Gasoline	$CH_{1.92}O_{0.03}S_0N_0$	0.833
E15 Gasoline	$CH_{1.95}O_{0.05}S_0N_0$	0.817
E85 Gasoline	$CH_{2.73}O_{0.38}S_0N_0$	0.576
E100 Ethanol	$CH_3O_{0.5}S_0N_0$	0.521
M100 Methanol	$CH_4O_1S_0N_0$	0.375
#1 Diesel	$CH_{1.93}O_0S_0N_0$	0.861
#2 Diesel	$CH_{1.80}O_0S_0N_0$	0.869
Liquefied petroleum gas	$CH_{2.64}O_0S_0N_0$	0.819
Natural gas	$CH_{3.78}O_{0.016}S_0N_0$	0.747
Residual fuel blends	Must be determined by measured fuel properties as described in paragraph (d)(1) of this section.	
Diesel exhaust fluid	$CH_{17.85}O_{7.92}S_0N_2$	0.065

(f) * * *

(3) Fluid mass flow rate calculation.

This calculation may be used only for steady-state laboratory testing. See § 1065.915(d)(5)(iv) for application to field testing. Calculate \dot{n}_{exh} based on using the following equation:

$$\dot{n}_{exh} = \sum_{j=1}^N \dot{m}_j \cdot \frac{w_C \cdot (1 + x_{H_2Oexhdry})}{M_C \cdot x_{Ccombdry}}$$

Eq. 1065.655-25

Where:

\dot{n}_{exh} = raw exhaust molar flow rate from which you measured emissions.

N = total number of fuels and injected fluids over the duty cycle.

j = an indexing variable that represents one fuel or injected fluid, starting with j = 1.

\dot{m}_j = the mass flow rate of the fuel or any injected fluid j.

Example:

N = 1

j = 1

 $\dot{m}_j = 7.559$ g/s $w_C = 0.869$ g/g $M_C = 12.0107$ g/mol

$X_{Ccombdry} = 99.87$ mmol/mol = 0.09987 mol/mol

$X_{H_2Oexhdry} = 107.64$ mmol/mol = 0.10764 mol/mol

$$\dot{n}_{exh} = 7.559 \cdot \frac{0.869 \cdot (1 + 0.10764)}{12.0107 \cdot 0.09987}$$

 $\dot{n}_{exh} = 6.066$ mol/s

* * * * *

■ 269. Section 1065.660 is amended as follows:

■ a. By revising the section heading.

■ b. By revising paragraphs (a)(2) and (3).

■ c. By adding paragraph (a)(4).

■ d. By revising paragraph (b)(3).

■ e. By adding paragraph (b)(4).

■ f. By redesignating paragraph (c) as paragraph (d).

■ g. By adding a new paragraph (c).

■ h. By revising newly redesignated paragraph (d).

■ i. By adding paragraph (e).

The revisions and additions read as follows:

§ 1065.660 THC, NMHC, NMNEHC, CH_4 , and C_2H_6 determination.

* * * * *

(a) * * *

(2) For the NMHC determination described in paragraph (b) of this section, correct $x_{THC[THC-FID]}$ for initial THC contamination using Eq. 1065.660–

1. You may correct $x_{\text{THC[NMC-FID]}}$ for initial contamination of the CH_4 sample train using Eq. 1065.660–1, substituting in CH_4 concentrations for THC.

(3) For the NMNEHC determination described in paragraph (c) of this section, correct $x_{\text{THC[THC-FID]}}$ for initial THC contamination using Eq. 1065.660–1. You may correct $x_{\text{THC[NMC-FID]}}$ for initial contamination of the CH_4 sample

train using Eq. 1065.660–1, substituting in CH_4 concentrations for THC.

(4) For the CH_4 determination described in paragraph (d) of this section, you may correct $x_{\text{THC[NMC-FID]}}$ for initial THC contamination of the CH_4 sample train using Eq. 1065.660–1, substituting in CH_4 concentrations for THC.

(b) * * *

(3) For a GC–FID or FTIR, calculate x_{NMHC} using the THC analyzer's response factor (RF) for CH_4 , from § 1065.360, and the initial THC contamination and dry-to-wet corrected THC concentration $x_{\text{THC[THC-FID]cor}}$ as determined in paragraph (a) of this section as follows:

$$x_{\text{NMHC}} = x_{\text{THC[THC-FID]cor}} - RF_{\text{CH4[THC-FID]}} \cdot x_{\text{CH4}}$$

Eq. 1065.660-5

Where:

x_{NMHC} = concentration of NMHC.

$x_{\text{THC[THC-FID]cor}}$ = concentration of THC, initial THC contamination and dry-to-wet corrected, as measured by the THC FID.

$RF_{\text{CH4[THC-FID]}}$ = response factor of THC–FID to CH_4 .

x_{CH4} = concentration of CH_4 , dry-to-wet corrected, as measured by the GC–FID or FTIR.

Example:

$x_{\text{THC[THC-FID]cor}} = 145.6 \mu\text{mol/mol}$

$RF_{\text{CH4[THC-FID]}} = 0.970$

$x_{\text{CH4}} = 18.9 \mu\text{mol/mol}$

$x_{\text{NMHC}} = 145.6 - 0.970 \cdot 18.9$

$x_{\text{NMHC}} = 127.3 \mu\text{mol/mol}$

(4) For an FTIR, calculate x_{NMHC} by summing the hydrocarbon species listed in § 1065.266(c) as follows:

$$x_{\text{NMHC}} = \sum_{i=1}^N (x_{\text{HCi}} - x_{\text{HCi-init}})$$

Eq. 1065.660-6

Where:

x_{NMHC} = concentration of NMHC.

x_{HCi} = the C_1 -equivalent concentration of hydrocarbon species i as measured by the FTIR, not corrected for initial contamination.

$x_{\text{HCi-init}}$ = the C_1 -equivalent concentration of the initial system contamination (optional) of hydrocarbon species i , dry-to-wet corrected, as measured by the FTIR.

Example:

$x_{\text{C2H6}} = 4.9 \mu\text{mol/mol}$

$x_{\text{C2H4}} = 0.9 \mu\text{mol/mol}$

$x_{\text{C2H2}} = 0.8 \mu\text{mol/mol}$

$x_{\text{C3H8}} = 0.4 \mu\text{mol/mol}$

$x_{\text{C3H6}} = 0.5 \mu\text{mol/mol}$

$x_{\text{C4H10}} = 0.3 \mu\text{mol/mol}$

$x_{\text{CH2O}} = 0.8 \mu\text{mol/mol}$

$x_{\text{C2H4O}} = 0.3 \mu\text{mol/mol}$

$x_{\text{C2H2O2}} = 0.1 \mu\text{mol/mol}$

$x_{\text{CH4O}} = 0.1 \mu\text{mol/mol}$

$x_{\text{NMHC}} = 4.9 + 0.9 + 0.8 + 0.4 + 0.5 + 0.3 + 0.8 + 0.3 + 0.1 + 0.1$

$x_{\text{NMHC}} = 9.1 \mu\text{mol/mol}$

(c) *NMNEHC determination.* Use one of the following methods to determine NMNEHC concentration, x_{NMNEHC} :

(1) If the content of your test fuel contains less than 0.010 mol/mol of

ethane, you may omit the calculation of NMNEHC concentrations and calculate the mass of NMNEHC as described in § 1065.650(c)(6).

(2) For a GC–FID or FTIR, calculate x_{NMNEHC} using the THC analyzer's response factors (RF) for CH_4 and C_2H_6 , from § 1065.360, and the initial contamination and dry-to-wet corrected THC concentration $x_{\text{THC[THC-FID]cor}}$ as determined in paragraph (a) of this section as follows:

$$x_{\text{NMNEHC}} = x_{\text{THC[THC-FID]cor}} - RF_{\text{CH4[THC-FID]}} \cdot x_{\text{CH4}} - RF_{\text{C2H6[THC-FID]}} \cdot x_{\text{C2H6}}$$

Eq. 1065.660-7

Where:

x_{NMNEHC} = concentration of NMNEHC.

$x_{\text{THC[THC-FID]cor}}$ = concentration of THC, initial THC contamination and dry-to-wet corrected, as measured by the THC FID.

$RF_{\text{CH4[THC-FID]}}$ = response factor of THC–FID to CH_4 .

x_{CH4} = concentration of CH_4 , dry-to-wet corrected, as measured by the GC–FID or FTIR.

$RF_{\text{C2H6[THC-FID]}}$ = response factor of THC–FID to C_2H_6 .

x_{C2H6} = the C_1 -equivalent concentration of C_2H_6 , dry-to-wet corrected, as measured by the GC–FID or FTIR.

Example:

$x_{\text{THC[THC-FID]cor}} = 145.6 \mu\text{mol/mol}$

$RF_{\text{CH4[THC-FID]}} = 0.970$

$x_{\text{CH4}} = 18.9 \mu\text{mol/mol}$

$RF_{\text{C2H6[THC-FID]}} = 1.02$

$x_{\text{C2H6}} = 10.6 \mu\text{mol/mol}$

$x_{\text{NMHC}} = 145.6 - 0.970 \cdot 18.9 - 1.02 \cdot 10.6$

$x_{\text{NMHC}} = 116.5 \mu\text{mol/mol}$

(3) For an FTIR, calculate x_{NMNEHC} by summing the hydrocarbon species listed in § 1065.266(c) as follows:

$$x_{\text{NMNEHC}} = \sum_{i=1}^N (x_{\text{HCi}} - x_{\text{HCi-init}})$$

Eq. 1065.660-8

Where:

 x_{NMNEHC} = concentration of NMNEHC. x_{HCi} = the C_1 -equivalent concentration of hydrocarbon species i as measured by the FTIR, not corrected for initial contamination. $x_{\text{HCi-init}}$ = the C_1 -equivalent concentration of the initial system contamination (optional) of hydrocarbon species i , dry-to-wet corrected, as measured by the FTIR.

Example:

 $x_{\text{C}_2\text{H}_4} = 0.9 \mu\text{mol/mol}$ $x_{\text{C}_2\text{H}_2} = 0.8 \mu\text{mol/mol}$ $x_{\text{C}_3\text{H}_8} = 0.4 \mu\text{mol/mol}$ $x_{\text{C}_3\text{H}_6} = 0.5 \mu\text{mol/mol}$ $x_{\text{C}_4\text{H}_{10}} = 0.3 \mu\text{mol/mol}$ $x_{\text{CH}_2\text{O}} = 0.8 \mu\text{mol/mol}$ $x_{\text{C}_2\text{H}_4\text{O}} = 0.3 \mu\text{mol/mol}$ $x_{\text{C}_2\text{H}_2\text{O}_2} = 0.1 \mu\text{mol/mol}$ $x_{\text{CH}_4\text{O}} = 0.1 \mu\text{mol/mol}$ $x_{\text{NMNEHC}} = 0.9 + 0.8 + 0.4 + 0.5 + 0.3 + 0.8 + 0.3 + 0.1 + 0.1$ $x_{\text{NMNEHC}} = 4.2 \mu\text{mol/mol}$ (d) CH_4 determination. Use one of the following methods to determine CH_4 concentration, x_{CH_4} :(1) For nonmethane cutters, calculate x_{CH_4} using the nonmethane cutter's penetration fraction (PF) of CH_4 and the response factor penetration fraction(RFPF) of C_2H_6 from § 1065.365, the response factor (RF) of the THC FID to CH_4 from § 1065.360, the initial THC contamination and dry-to-wet corrected THC concentration $x_{\text{THC}[\text{THC-FID}]\text{cor}}$ as determined in paragraph (a) of this section, and the dry-to-wet corrected CH_4 concentration $x_{\text{THC}[\text{NMC-FID}]\text{cor}}$ optionally corrected for initial THC contamination as determined in paragraph (a) of this section.

(i) Use the following equation for penetration fractions determined using an NMC configuration as outlined in § 1065.365(d):

$$x_{\text{CH}_4} = \frac{x_{\text{THC}[\text{NMC-FID}]\text{cor}} - x_{\text{THC}[\text{THC-FID}]\text{cor}} \cdot RFPF_{\text{C}_2\text{H}_6[\text{NMC-FID}]}}{1 - RFPF_{\text{C}_2\text{H}_6[\text{NMC-FID}]} \cdot RF_{\text{CH}_4[\text{THC-FID}]}}$$

Eq. 1065.660-9

Where:

 x_{CH_4} = concentration of CH_4 . $x_{\text{THC}[\text{NMC-FID}]\text{cor}}$ = concentration of THC, initial THC contamination (optional) and dry-to-wet corrected, as measured by the NMC FID during sampling through the NMC. $x_{\text{THC}[\text{THC-FID}]\text{cor}}$ = concentration of THC, initial THC contamination and dry-to-wet corrected, as measured by the THC FID during sampling while bypassing the NMC. $RFPF_{\text{C}_2\text{H}_6[\text{NMC-FID}]}$ = the combined ethane response factor and penetration fraction of the nonmethane cutter, according to § 1065.365(d). $RF_{\text{CH}_4[\text{THC-FID}]}$ = response factor of THC FID to CH_4 , according to § 1065.360(d).

Example:

 $x_{\text{THC}[\text{NMC-FID}]\text{cor}} = 10.4 \mu\text{mol/mol}$ $x_{\text{THC}[\text{THC-FID}]\text{cor}} = 150.3 \mu\text{mol/mol}$ $RFPF_{\text{C}_2\text{H}_6[\text{NMC-FID}]} = 0.019$ $RF_{\text{CH}_4[\text{THC-FID}]} = 1.05$

$$x_{\text{CH}_4} = \frac{10.4 - 150.3 \cdot 0.019}{1 - 0.019 \cdot 1.05}$$

 $x_{\text{CH}_4} = 7.69 \mu\text{mol/mol}$

(ii) For penetration fractions determined using an NMC configuration

as outlined in § 1065.365(e), use the following equation:

$$x_{\text{CH}_4} = \frac{x_{\text{THC}[\text{NMC-FID}]\text{cor}} - x_{\text{THC}[\text{THC-FID}]\text{cor}} \cdot PF_{\text{C}_2\text{H}_6[\text{NMC-FID}]}}{RF_{\text{CH}_4[\text{THC-FID}]} \cdot (PF_{\text{CH}_4[\text{NMC-FID}]} - PF_{\text{C}_2\text{H}_6[\text{NMC-FID}]})}$$

Eq. 1065.660-10

Where:

 x_{CH_4} = concentration of CH_4 . $x_{\text{THC}[\text{NMC-FID}]\text{cor}}$ = concentration of THC, initial THC contamination (optional) and dry-to-wet corrected, as measured by the NMC FID during sampling through the NMC. $x_{\text{THC}[\text{THC-FID}]\text{cor}}$ = concentration of THC, initial THC contamination and dry-to-

wet corrected, as measured by the THC FID during sampling while bypassing the NMC.

 $PF_{\text{C}_2\text{H}_6[\text{NMC-FID}]}$ = nonmethane cutter ethane penetration fraction, according to § 1065.365(e). $RF_{\text{CH}_4[\text{THC-FID}]}$ = response factor of THC FID to CH_4 , according to § 1065.360(d). $PF_{\text{CH}_4[\text{NMC-FID}]}$ = nonmethane cutter CH_4 penetration fraction, according to § 1065.365(e).

Example:

 $x_{\text{THC}[\text{NMC-FID}]\text{cor}} = 10.4 \mu\text{mol/mol}$ $x_{\text{THC}[\text{THC-FID}]\text{cor}} = 150.3 \mu\text{mol/mol}$ $PF_{\text{C}_2\text{H}_6[\text{NMC-FID}]} = 0.020$ $RF_{\text{CH}_4[\text{THC-FID}]} = 1.05$ $PF_{\text{CH}_4[\text{NMC-FID}]} = 0.990$

$$x_{\text{CH}_4} = \frac{10.4 - 150.3 \cdot 0.020}{1.05 \cdot (0.990 - 0.020)}$$

$x_{\text{CH}_4} = 7.25 \text{ } \mu\text{mol/mol}$

(iii) For penetration fractions determined using an NMC configuration as outlined in § 1065.365(f), use the following equation:

$$x_{\text{CH}_4} = \frac{x_{\text{THC}[\text{NMC-FID}]\text{cor}} - x_{\text{THC}[\text{THC-FID}]\text{cor}} \cdot RFPF_{\text{C}_2\text{H}_6[\text{NMC-FID}]}}{PF_{\text{CH}_4[\text{NMC-FID}]} - RFPF_{\text{C}_2\text{H}_6[\text{NMC-FID}]} \cdot RF_{\text{CH}_4[\text{THC-FID}]}}$$

Eq. 1065.660-11

Where:

x_{CH_4} = concentration of CH_4 .

$x_{\text{THC}[\text{NMC-FID}]\text{cor}}$ = concentration of THC, initial THC contamination (optional) and dry-to-wet corrected, as measured by the NMC FID during sampling through the NMC.

$x_{\text{THC}[\text{THC-FID}]\text{cor}}$ = concentration of THC, initial THC contamination and dry-to-

wet corrected, as measured by the THC FID during sampling while bypassing the NMC.

$RFPF_{\text{C}_2\text{H}_6[\text{NMC-FID}]}$ = the combined ethane response factor and penetration fraction of the nonmethane cutter, according to § 1065.365(f).

$PF_{\text{CH}_4[\text{NMC-FID}]}$ = nonmethane cutter CH_4 penetration fraction, according to § 1065.365(f).

$RF_{\text{CH}_4[\text{THC-FID}]}$ = response factor of THC FID to CH_4 , according to § 1065.360(d).

Example:

$x_{\text{THC}[\text{NMC-FID}]\text{cor}} = 10.4 \text{ } \mu\text{mol/mol}$
 $x_{\text{THC}[\text{THC-FID}]\text{cor}} = 150.3 \text{ } \mu\text{mol/mol}$
 $RFPF_{\text{C}_2\text{H}_6[\text{NMC-FID}]} = 0.019$
 $PF_{\text{CH}_4[\text{NMC-FID}]} = 0.990$
 $RF_{\text{CH}_4[\text{THC-FID}]} = 1.05$

$$x_{\text{CH}_4} = \frac{10.4 - 150.3 \cdot 0.019}{0.990 - 0.019 \cdot 1.05}$$

$x_{\text{CH}_4} = 7.78 \text{ } \mu\text{mol/mol}$

(2) For a GC-FID or FTIR, x_{CH_4} is the actual dry-to-wet corrected CH_4 concentration as measured by the analyzer.

(e) C_2H_6 determination. For a GC-FID or FTIR, $x_{\text{C}_2\text{H}_6}$ is the C_1 -equivalent, dry-to-wet corrected C_2H_6 concentration as measured by the analyzer.

■ 270. Section 1065.665 is amended by revising paragraphs (a) and (b) to read as follows:

§ 1065.665 THCE and NMHCE determination.

(a) If you measured an oxygenated hydrocarbon's mass concentration, first calculate its molar concentration in the exhaust sample stream from which the sample was taken (raw or diluted exhaust), and convert this into a C_1 -equivalent molar concentration. Add these C_1 -equivalent molar concentrations to the molar concentration of non-oxygenated total

hydrocarbon (NOTHC). The result is the molar concentration of total hydrocarbon equivalent (THCE). Calculate THCE concentration using the following equations, noting that Eq. 1065.665-3 is required only if you need to convert your oxygenated hydrocarbon (OHC) concentration from mass to moles:

$$x_{\text{THCE}} = x_{\text{NOTHC}} + \sum_{i=1}^N (x_{\text{OHC}_i} - x_{\text{OHC}_i\text{-init}})$$

Eq. 1065.665-1

$$x_{\text{NOTHC}} = x_{\text{THC}[\text{THC-FID}]\text{cor}} - \sum_{i=1}^N ((x_{\text{OHC}_i} - x_{\text{OHC}_i\text{-init}}) \cdot RF_{\text{OHC}_i[\text{THC-FID}]})$$

Eq. 1065.665-2

$$x_{\text{OHCi}} = \frac{\frac{m_{\text{dexhOHCi}}}{M_{\text{OHCi}}}}{\frac{m_{\text{dexh}}}{M_{\text{dexh}}}} = \frac{n_{\text{dexhOHCi}}}{n_{\text{dexh}}}$$

Eq. 1065.665-3

Where:

x_{THCE} = the sum of the C₁-equivalent concentrations of non-oxygenated hydrocarbon, alcohols, and aldehydes.

x_{NOTHC} = the sum of the C₁-equivalent concentrations of NOTHC.

x_{OHCi} = the C₁-equivalent concentration of oxygenated species *i* in diluted exhaust, not corrected for initial contamination.

$x_{\text{OHCi-init}}$ = the C₁-equivalent concentration of the initial system contamination (optional) of oxygenated species *i*, dry-to-wet corrected.

$x_{\text{THC[THC-FID]cor}}$ = the C₁-equivalent response to NOTHC and all OHC in diluted exhaust, HC contamination and dry-to-wet corrected, as measured by the THC-FID.

$RF_{\text{OHCi[THC-FID]}}$ = the response factor of the FID to species *i* relative to propane on a C₁-equivalent basis.

$C^{\#}$ = the mean number of carbon atoms in the particular compound.

M_{dexh} = the molar mass of diluted exhaust as determined in § 1065.340.

m_{dexhOHCi} = the mass of oxygenated species *i* in dilute exhaust.

M_{OHCi} = the C₁-equivalent molecular weight of oxygenated species *i*.

m_{dexh} = the mass of diluted exhaust

n_{dexhOHCi} = the number of moles of oxygenated species *i* in total diluted exhaust flow.

n_{dexh} = the total diluted exhaust flow.

(b) If we require you to determine nonmethane hydrocarbon equivalent (NMHCE), use the following equation:

$$x_{\text{NMHCE}} = x_{\text{THCE}} - RF_{\text{CH4[THC-FID]}} \cdot x_{\text{CH4}}$$

Eq. 1065.665-4

Where:

x_{NMHCE} = the sum of the C₁-equivalent concentrations of nonoxygenated nonmethane hydrocarbon (NONMHC), alcohols, and aldehydes.

$RF_{\text{CH4[THC-FID]}}$ = the response factor of THC-FID to CH₄.

x_{CH4} = concentration of CH₄, HC contamination (optional) and dry-to-wet corrected, as measured by the gas chromatograph FID.

■ 271. Section 1065.667 is amended by revising paragraph (c) to read as follows:

§ 1065.667 Dilution air background emission correction.

* * * * *

(c) You may determine the total flow of dilution air by subtracting the calculated raw exhaust molar flow as described in § 1065.655(g) from the measured dilute exhaust flow. This may

be done by totaling continuous calculations or by using batch results.

* * * * *

■ 272. Section 1065.675 is amended by revising paragraph (d) to read as follows:

§ 1065.675 CLD quench verification calculations.

* * * * *

(d) Calculate quench as follows:

$$quench = \left(\left(\frac{x_{\text{NOwet}}}{1 - x_{\text{H2Omeas}}} - 1 \right) \cdot \frac{x_{\text{H2Oexp}}}{x_{\text{H2Omeas}}} + \left(\frac{x_{\text{NOmeas}}}{x_{\text{NOact}}} - 1 \right) \cdot \frac{x_{\text{CO2exp}}}{x_{\text{CO2act}}} \right) \cdot 100 \%$$

Eq. 1065.675-1

Where:

quench = amount of CLD quench.

x_{NOdry} = concentration of NO upstream of a bubbler, according to § 1065.370(e)(4).

x_{NOwet} = measured concentration of NO downstream of a bubbler, according to § 1065.370(e)(9).

x_{H2Oexp} = maximum expected mole fraction of water during emission testing, according to paragraph (b) of this section.

x_{H2Omeas} = measured mole fraction of water during the quench verification, according to § 1065.370(e)(7).

x_{NOmeas} = measured concentration of NO when NO span gas is blended with CO₂ span gas, according to § 1065.370(d)(10).

x_{NOact} = actual concentration of NO when NO span gas is blended with CO₂ span gas, according to § 1065.370(d)(11) and calculated according to Eq. 1065.675-2.

x_{CO2exp} = maximum expected concentration of CO₂ during emission testing, according to paragraph (c) of this section.

x_{CO2act} = actual concentration of CO₂ when NO span gas is blended with CO₂ span gas, according to § 1065.370(d)(9).

$$x_{\text{NOact}} = \left(1 - \frac{x_{\text{CO2act}}}{x_{\text{CO2span}}} \right) \cdot x_{\text{NOspan}}$$

Eq. 1065.675-2

Where:

x_{NOspan} = The NO span gas concentration input to the gas divider, according to § 1065.370(d)(5).

x_{CO2span} = the CO₂ span gas concentration input to the gas divider, according to § 1065.370(d)(4).

Example:

$x_{\text{NOdry}} = 1800.0 \mu\text{mol/mol}$
 $x_{\text{NOWet}} = 1739.6 \mu\text{mol/mol}$
 $x_{\text{H2Oexp}} = 0.030 \text{ mol/mol}$
 $x_{\text{H2Omeas}} = 0.030 \text{ mol/mol}$
 $x_{\text{NOmeas}} = 1515.2 \mu\text{mol/mol}$
 $x_{\text{NOspan}} = 3001.6 \mu\text{mol/mol}$

$x_{\text{CO2exp}} = 3.2\%$
 $x_{\text{CO2span}} = 6.1\%$
 $x_{\text{CO2act}} = 2.98\%$

$$x_{\text{NOact}} = \left(1 - \frac{2.98}{6.1} \right) \cdot 3001.6 = 1535.24459 \mu\text{mol/mol}$$

$$\text{quench} = \left(\left(\frac{1739.6}{1 - 0.030} - 1 \right) \cdot \frac{0.030}{0.030} + \left(\frac{1515.2}{1535.24459} - 1 \right) \cdot \frac{3.2}{2.98} \right) \cdot 100 \%$$

$\text{quench} = (-0.0036655 - 0.014020171) \cdot 100\%$
 $= -1.7685671\%$

* * * * *

■ 273. Section 1065.680 is added to subpart G to read as follows:

§ 1065.680 Adjusting emission levels to account for infrequently regenerating aftertreatment devices.

This section describes how to calculate and apply emission adjustment factors for engines using aftertreatment technology with infrequent regeneration events that may occur during testing. These adjustment factors are typically calculated based on measurements conducted for the purposes of engine certification, and then used to adjust the results of testing

related to demonstrating compliance with emission standards. For this section, “regeneration” means an intended event during which emission levels change while the system restores aftertreatment performance. For example, exhaust gas temperatures may increase temporarily to remove sulfur from adsorbers or to oxidize accumulated particulate matter in a trap. Also, “infrequent” refers to regeneration events that are expected to occur on average less than once over a transient or ramped-modal duty cycle, or on average less than once per mode in a discrete-mode test.

(a) Apply adjustment factors based on whether there is active regeneration

during a test segment. The test segment may be a test interval or a full duty cycle, as described in paragraph (b) of this section. For engines subject to standards over more than one duty cycle, you must develop adjustment factors under this section for each separate duty cycle. You must be able to identify active regeneration in a way that is readily apparent during all testing. All adjustment factors for regeneration are additive.

(1) If active regeneration does not occur during a test segment, apply an upward adjustment factor, *UAF*, that will be added to the measured emission rate for that test segment. Use the following equation to calculate *UAF*:

$$UAF_{[\text{cycle}]} = EF_{A[\text{cycle}]} - EF_{L[\text{cycle}]}$$

Eq. 1065.680-1

Where:

$EF_{A[\text{cycle}]}$ = the average emission factor over the test segment as determined in paragraph (a)(4) of this section.

$EF_{L[\text{cycle}]}$ = measured emissions over a complete test segment in which active regeneration does not occur.

Example:

$EF_{\text{ARMC}} = 0.15 \text{ g/kW}\cdot\text{hr}$
 $EF_{\text{LRMC}} = 0.11 \text{ g/kW}\cdot\text{hr}$
 $UAF_{\text{RMC}} = 0.15 - 0.11 = 0.04 \text{ g/kW}\cdot\text{hr}$

(2) If active regeneration occurs or starts to occur during a test segment,

apply a downward adjustment factor, *DAF*, that will be subtracted from the measured emission rate for that test segment. Use the following equation to calculate *DAF*:

$$DAF_{[cycle]} = EF_{H[cycle]} - EF_{A[cycle]}$$

Eq. 1065.680-2

Where:

$EF_{H[cycle]}$ = measured emissions over the test segment from a complete regeneration event, or the average emission rate over multiple complete test segments with regeneration if the complete regeneration event lasts longer than one test segment.

Example:

$$\begin{aligned} EF_{ARMC} &= 0.15 \text{ g/kW}\cdot\text{hr} \\ EF_{HRMC} &= 0.50 \text{ g/kW}\cdot\text{hr} \\ DAF_{RMC} &= 0.50 - 0.15 = 0.35 \text{ g/kW}\cdot\text{hr} \end{aligned}$$

(3) Note that emissions for a given pollutant may be lower during

regeneration, in which case EF_L would be greater than EF_H , and both UAF and DAF would be negative.

(4) Calculate the average emission factor, EF_A , as follows:

$$EF_{A[cycle]} = F_{[cycle]} \cdot EF_{H[cycle]} + (1.00 - F_{[cycle]}) \cdot EF_{L[cycle]}$$

Eq. 1065.680-3

Where:

$F_{[cycle]}$ = the frequency of the regeneration event during the test segment, expressed in terms of the fraction of equivalent test segments during which active regeneration occurs, as described in paragraph (a)(5) of this section.

Example:

$$\begin{aligned} F_{RMC} &= 0.10 \\ EF_{ARMC} &= 0.10 \cdot 0.50 + (1.00 - 0.10) \cdot 0.11 \\ &= 0.15 \text{ g/kW}\cdot\text{hr} \end{aligned}$$

(5) The frequency of regeneration, F , generally characterizes how often a

regeneration event occurs within a series of test segments. Determine F using the following equation, subject to the provisions of paragraph (a)(6) of this section:

$$F_{[cycle]} = \frac{i_{r[cycle]}}{i_{fl[cycle]} + i_{r[cycle]}}$$

Eq. 1065.680-4

Where:

$i_{r[cycle]}$ = the number of successive test segments required to complete an active regeneration, rounded up to the next whole number.

$i_{fl[cycle]}$ = the number of test segments from the end of one complete regeneration event to the start of the next active regeneration, without rounding.

Example:

$$i_{rRMC} = 2$$

$$i_{flRMC} = 17.86$$

$$F_{RMC} = \frac{2}{17.86 + 2} = 0.10$$

(6) Use good engineering judgment to determine i_r and i_{fl} , as follows:

(i) For engines that are programmed to regenerate after a specific time interval, you may determine the duration of a regeneration event and the time between regeneration events based on the engine's design parameters. For other engines, determine these values based on measurements from in-use operation or from running repetitive duty cycles in a laboratory.

(ii) For engines subject to standards over multiple duty cycles, such as for transient and steady-state testing, apply this same calculation to determine a value of F for each duty cycle.

(iii) Consider an example for an engine that is designed to regenerate its PM filter 500 minutes after the end of the last regeneration event, with the

regeneration event lasting 30 minutes. If the RMC takes 28 minutes, $i_{rRMC} = 2$ ($30 \div 28 = 1.07$, which rounds up to 2), and $i_{flRMC} = 500 \div 28 = 17.86$.

(b) Develop adjustment factors for different types of testing as follows:

(1) *Discrete-mode testing.* Develop separate adjustment factors for each test mode (test interval) of a discrete-mode test. When measuring EF_H , if a regeneration event has started but is not complete when you reach the end of the sampling time for a test interval, extend the sampling period for that test interval until the regeneration event is complete.

(2) *Ramped-modal and transient testing.* Develop a separate set of adjustment factors for an entire ramped-modal cycle or transient duty cycle. When measuring EF_H , if a regeneration event has started but is not complete

when you reach the end of the duty cycle, start the next repeat test as soon as possible, allowing for the time needed to complete emission measurement and installation of new filters for PM measurement; in that case EF_H is the average emission level for the test segments that included regeneration.

(3) *Accounting for cold-start measurements.* For engines subject to cold-start testing requirements, incorporate cold-start operation into your analysis as follows:

(i) Determine the frequency of regeneration, F , in a way that incorporates the impact of cold-start operation in proportion to the cold-start weighting factor specified in the standard-setting part. You may use good engineering judgment to determine the

effect of cold-start operation analytically.

(ii) Treat cold-start testing and hot-start testing together as a single test segment for adjusting measured emission results under this section. Apply the adjustment factor to the composite emission result.

(iii) You may apply the adjustment factor only to the hot-start test result if your aftertreatment technology does not regenerate during cold operation as represented by the cold-start transient duty cycle. If we ask for it, you must demonstrate this by engineering analysis or by test data.

(c) If an engine has multiple regeneration strategies, determine and apply adjustment factors under this section separately for each type of regeneration.

■ 274. Section 1065.690 is amended by revising paragraph (c) to read as follows:

§ 1065.690 Buoyancy correction for PM sample media.

* * * * *

(c) *Air density*. Because a PM balance environment must be tightly controlled to an ambient temperature of $(22 \pm 1)^\circ\text{C}$ and humidity has an insignificant effect on buoyancy correction, air density is primarily a function of atmospheric pressure. Therefore you may use nominal constant values for temperature and humidity when determining the air density of the balance environment in Eq. 1065.690–2.

* * * * *

Subpart H—Engine Fluids, Test Fuels, Analytical Gases and Other Calibration Standards

■ 275. A new § 1065.735 is added to subpart H to read as follows:

§ 1065.735 Diesel exhaust fluid.

(a) Use commercially available diesel exhaust fluid that represents the product that will be used in your in-use engines.

(b) Diesel exhaust fluid for testing must generally conform to the specifications referenced in the definition of “diesel exhaust fluid” in § 1065.1001. Use marine-grade diesel exhaust fluid only for marine engines.

■ 276. Section 1065.750 is amended by adding new paragraphs (a)(3)(xii) and (xiii) to read as follows:

§ 1065.750 Analytical gases.

* * * * *

(a) * * *

(3) * * *

(xii) CH_4 , C_2H_6 , balance purified air and/or N_2 (as applicable).

(xiii) CH_4 , CH_2O , CH_2O_2 , C_2H_2 , C_2H_4 , $\text{C}_2\text{H}_4\text{O}$, C_2H_6 , C_3H_8 , C_3H_6 , CH_4O , and C_4H_{10} . You may omit individual gas constituents from this gas mixture. If your gas mixture contains oxygenated hydrocarbon, your gas mixture must be in balance purified N_2 , otherwise you may use balance purified air.

* * * * *

Subpart K—Definitions and Other Reference Information

■ 277. Section 1065.1001 is amended as follows:

■ a. By adding definitions for “Average” and “ C_1 -equivalent” in alphabetical order.

■ b. By removing the definition for “ C_1 equivalent (or basis)”.

■ c. By adding a definition for “Diesel exhaust fluid (DEF)” in alphabetical order.

■ d. By revising the definitions for “Hydrocarbon (HC)” and “Linearity”.

■ e. By adding a definition for “Nonmethane nonethane hydrocarbon (NMNEHC)” in alphabetical order.

The added and revised definitions read as follows:

§ 1065.1001 Definitions.

* * * * *

Average means the arithmetic mean of a sample.

* * * * *

C_1 -equivalent means a convention of expressing HC concentrations based on the total number of carbon atoms present, such that the C_1 -equivalent of a molar HC concentration equals the molar concentration multiplied by the mean number of carbon atoms in each HC molecule. For example, the C_1 -equivalent of $10\ \mu\text{mol/mol}$ of propane (C_3H_8) is $30\ \mu\text{mol/mol}$. C_1 -equivalent molar values may be denoted as “ppmC” in the standard-setting part. Molar mass may also be expressed on a C_1 basis. Note that calculating HC

masses from molar concentrations and molar masses is only valid where they are each expressed on the same carbon basis.

* * * * *

Diesel exhaust fluid (DEF) means a liquid reducing agent (other than the engine fuel) used in conjunction with selective catalytic reduction to reduce NO_x emissions. *Diesel exhaust fluid* is generally understood to be an aqueous solution of urea conforming to the specifications of ISO 18611 or ISO 22241.

* * * * *

Hydrocarbon (HC) means THC, THCE, NMHC, NMNEHC, NMOG, or NMHCE, as applicable. Hydrocarbon generally means the hydrocarbon group on which the emission standards are based for each type of fuel and engine.

* * * * *

Linearity means the degree to which measured values agree with respective reference values. Linearity is quantified using a linear regression of pairs of measured values and reference values over a range of values expected or observed during testing. Perfect linearity would result in an intercept, a_0 , equal to zero, a slope, a_1 , of one, a coefficient of determination, r^2 , of one, and a standard error of the estimate, *SEE*, of zero. The term “linearity” is not used in this part to refer to the shape of a measurement instrument’s unprocessed response curve, such as a curve relating emission concentration to voltage output. A properly performing instrument with a nonlinear response curve will meet linearity specifications.

* * * * *

Nonmethane nonethane hydrocarbon (NMNEHC) means the sum of all hydrocarbon species except methane and ethane. Refer to § 1065.660 for NMNEHC determination.

* * * * *

■ 278. Section 1065.1005 is amended by revising paragraphs (a), (b), and (f)(2) to read as follows:

§ 1065.1005 Symbols, abbreviations, acronyms, and units of measure.

* * * * *

(a) *Symbols for quantities*. This part uses the following symbols and units of measure for various quantities:

Sym- bol	Quantity	Unit	Unit symbol	Units in terms of SI base units
α	atomic hydrogen-to-carbon ratio	mole per mole	mol/mol	1.
A	area	square meter	m^2	m^2 .
a_0	intercept of least squares regression.			
a_1	slope of least squares regression.			
a_g	acceleration of Earth’s gravity	meter per square second	m/s^2	$\text{m}\cdot\text{s}^{-2}$.
β	ratio of diameters	meter per meter	m/m	1.

Symbol	Quantity	Unit	Unit symbol	Units in terms of SI base units
β	atomic oxygen-to-carbon ratio	mole per mole	mol/mol	1.
$C_{\#}$...	number of carbon atoms in a molecule.			
C_d ...	discharge coefficient.			
C_f ...	flow coefficient.			
δ	atomic nitrogen-to-carbon ratio	mole per mole	mol/mol	1.
d	Diameter	meter	m	m.
DR ..	dilution ratio	mole per mole	mol/mol	1.
ε	error between a quantity and its reference.			
e	brake-specific emission or fuel consumption	gram per kilowatt hour	g/(kW-hr)	$g \cdot 3.6 \cdot 10^{-3} \cdot kg^{-1} \cdot s^2$.
F	F-test statistic.			
f	frequency	hertz	Hz	s^{-1} .
f_n	angular speed (shaft)	revolutions per minute	r/min	$\pi \cdot 30^{-1} \cdot s^{-1}$.
γ	ratio of specific heats	(joule per kilogram kelvin) per (joule per kilogram kelvin).	(J/(kg·K))/(J/(kg·K))	1.
γ	atomic sulfur-to-carbon ratio	mole per mole	mol/mol	1.
K	correction factor			1.
K_v ...	calibration coefficient		$m^4 \cdot s \cdot K^{0.5} / kg$	$m^4 \cdot kg^{-1} \cdot s \cdot K^{0.5}$.
l	length	meter	m	m.
μ	viscosity, dynamic	pascal second	Pa·s	$m^{-1} \cdot kg \cdot s^{-1}$.
M	molar mass ¹	gram per mole	g/mol	$10^{-3} \cdot kg \cdot mol^{-1}$.
m	mass	kilogram	kg	kg.
\dot{m}	mass rate	kilogram per second	kg/s	$kg \cdot s^{-1}$.
ν	viscosity, kinematic	meter squared per second	m^2/s	$m^2 \cdot s^{-1}$.
N	total number in series.			
n	amount of substance	mole	mol	mol.ROW \leq
\dot{n}	amount of substance rate	mole per second	mol/s	$mol \cdot s^{-1}$.
P	power	kilowatt	kW	$10^3 \cdot m$
PF ..	penetration fraction.			
p	pressure	pascal	Pa	$m^{-1} \cdot kg \cdot s^{-2}$.
ρ	mass density	kilogram per cubic meter	kg/m^3	$m^{-3} \cdot kg$.
Δp ...	differential static pressure	pascal	Pa	$m^{-1} \cdot kg \cdot s^{-2}$.
r	ratio of pressures	pascal per pascal	Pa/Pa	1.
r^2	coefficient of determination.			
Ra ..	average surface roughness	micrometer	μm	$10^{-6} \cdot m$.
$Re^{\#}$	Reynolds number.			
RF ..	response factor.			
RH ..	relative humidity.			
σ	non-biased standard deviation.			
S	Sutherland constant	kelvin	K	K.
SEE	standard estimate of error.			
T	absolute temperature	kelvin	K	K.
T	Celsius temperature	degree Celsius	$^{\circ}C$	$K - 273.15$.
T	torque (moment of force)	newton meter	$N \cdot m$	$m^2 \cdot kg \cdot s^{-2}$.
θ	plane angle	degrees	$^{\circ}$	rad.
t	time	second	s	s.
Δt ...	time interval, period, 1/frequency	second	s	s.
V	volume	cubic meter	m^3	m^3 .
\dot{V}	volume rate	cubic meter per second	m^3/s	$m^3 \cdot s^{-1}$.
W	work	kilowatt-hour	kW-hr	$3.6^{-1} \cdot 10^6 \cdot m^2 \cdot kg \cdot s^{-2}$.
w_C ...	carbon mass fraction	gram per gram	g/g	1.
x	amount of substance mole fraction ²	mole per mole	mol/mol	1.
\bar{x}	flow-weighted mean concentration	mole per mole	mol/mol	1.
y	generic variable.			
Z	compressibility factor.			

¹ See paragraph (f)(2) of this section for the values to use for molar masses. Note that in the cases of NO_x and HC, the regulations specify effective molar masses based on assumed speciation rather than actual speciation.

² Note that mole fractions for THC, THCE, NMHC, NMHCE, and NOTHC are expressed on a C₁-equivalent basis.

(b) *Symbols for chemical species.* This part uses the following symbols for chemical species and exhaust constituents:

Symbol	Species
Ar	argon.
C	carbon.
CH ₂ O	formaldehyde.

Symbol	Species
CH ₂ O ₂	formic acid.
CH ₃ OH	methanol.
CH ₄	methane.
C ₂ H ₄ O	acetaldehyde.
C ₂ H ₅ OH	ethanol.
C ₂ H ₆	ethane.
C ₃ H ₇ OH	propanol.
C ₃ H ₈	propane.
C ₄ H ₁₀	butane.

Symbol	Species
C ₅ H ₁₂	pentane.
CO	carbon monoxide.
CO ₂	carbon dioxide.
H	atomic hydrogen.
H ₂	molecular hydrogen.
H ₂ O	water.
H ₂ SO ₄	sulfuric acid.
HC	hydrocarbon.
He	helium.

Symbol	Species	Symbol	Species	Symbol	Species
⁸⁵ Kr	krypton 85.	N ₂ O	nitrous oxide.	SVOC	semi-volatile organic compound.
N ₂	molecular nitrogen.	NMOG	nonmethane organic gases.	THC	total hydrocarbon.
NH ₃	ammonia.	NONMHC	non-oxygenated nonmethane hydrocarbon.	THCE	total hydrocarbon equivalent.
NMHC	nonmethane hydrocarbon.	NOTHC	non-oxygenated total hydrocarbon.	ZrO ₂	zirconium dioxide.
NMHCE	nonmethane hydrocarbon equivalent.	O ₂	molecular oxygen.	* * * * *	
NMNEHC	nonmethane-nonethane hydrocarbon.	OHC	oxygenated hydrocarbon.		
NO	nitric oxide.	²¹⁰ Po	polonium 210.		
NO ₂	nitrogen dioxide.	PM	particulate matter.	(f) * * *	
NO _x	oxides of nitrogen.	S	sulfur.	(2) This part uses the following molar masses or effective molar masses of chemical species:	

Symbol	Quantity	g/mol (10 ⁻³ ·kg·mol ⁻¹)
M _{air}	molar mass of dry air ¹	28.96559
M _{Ar}	molar mass of argon	39.948
M _C	molar mass of carbon	12.0107
M _{CH₃OH}	molar mass of methanol	32.04186
M _{C₂H₅OH}	molar mass of ethanol	46.06844
M _{C₂H₄O}	molar mass of acetaldehyde	44.05256
M _{CH₄N₂O}	molar mass of urea	60.05526
M _{C₃H₈}	molar mass of propane	44.09562
M _{C₃H₇OH}	molar mass of propanol	60.09502
M _{CO}	molar mass of carbon monoxide	28.0101
M _{CH₄}	molar mass of methane	16.0425
M _{CO₂}	molar mass of carbon dioxide	44.0095
M _H	molar mass of atomic hydrogen	1.00794
M _{H₂}	molar mass of molecular hydrogen	2.01588
M _{H₂O}	molar mass of water	18.01528
M _{CH₂O}	molar mass of formaldehyde	30.02598
M _{He}	molar mass of helium	4.002602
M _N	molar mass of atomic nitrogen	14.0067
M _{N₂}	molar mass of molecular nitrogen	28.0134
M _{NH₃}	molar mass of ammonia	17.03052
M _{NMHC}	effective C ₁ molar mass of nonmethane hydrocarbon ²	13.875389
M _{NMHCE}	effective C ₁ molar mass of nonmethane hydrocarbon equivalent ²	13.875389
M _{NMNEHC}	effective C ₁ molar mass of nonmethane-nonethane hydrocarbon ²	13.875389
M _{NO_x}	effective molar mass of oxides of nitrogen ³	46.0055
M _{N₂O}	molar mass of nitrous oxide	44.0128
M _O	molar mass of atomic oxygen	15.9994
M _{O₂}	molar mass of molecular oxygen	31.9988
M _S	molar mass of sulfur	32.065
M _{THC}	effective C ₁ molar mass of total hydrocarbon ²	13.875389
M _{THCE}	effective C ₁ molar mass of total hydrocarbon equivalent ²	13.875389

¹ See paragraph (f)(1) of this section for the composition of dry air.

² The effective molar masses of THC, THCE, NMHC, NMHCE, and NMNEHC are defined on a C₁ basis and are based on an atomic hydrogen-to-carbon ratio, α, of 1.85 (with β, γ, and δ equal to zero).

³ The effective molar mass of NO_x is defined by the molar mass of nitrogen dioxide, NO₂.

* * *

■ 279. Section 1065.1010 is amended by revising paragraphs (b) and (e) to read as follows:

§ 1065.1010 Incorporation by reference.

* * *

(b) *ASTM material.* The following standards are available from ASTM International, 100 Barr Harbor Dr., P.O. Box C700, West Conshohocken, PA 19428–2959, (877) 909–2786, or <http://www.astm.org>:

(1) ASTM D86–12, Standard Test Method for Distillation of Petroleum Products at Atmospheric Pressure, approved December 1, 2012 (“ASTM D86”), IBR approved for §§ 1065.703(b) and 1065.710(b) and (c).

(2) ASTM D93–13, Standard Test Methods for Flash Point by Pensky-Martens Closed

Cup Tester, approved July 15, 2013 (“ASTM D93”), IBR approved for § 1065.703(b).

(3) ASTM D130–12, Standard Test Method for Corrosiveness to Copper from Petroleum Products by Copper Strip Test, approved November 1, 2012 (“ASTM D130”), IBR approved for § 1065.710(b).

(4) ASTM D381–12, Standard Test Method for Gum Content in Fuels by Jet Evaporation, approved April 15, 2012 (“ASTM D381”), IBR approved for § 1065.710(b).

(5) ASTM D445–12, Standard Test Method for Kinematic Viscosity of Transparent and Opaque Liquids (and Calculation of Dynamic Viscosity), approved April 15, 2012 (“ASTM D445”), IBR approved for § 1065.703(b).

(6) ASTM D525–12a, Standard Test Method for Oxidation Stability of Gasoline (Induction Period Method), approved September 1, 2012 (“ASTM D525”), IBR approved for § 1065.710(b).

(7) ASTM D613–13, Standard Test Method for Cetane Number of Diesel Fuel Oil, approved December 1, 2013 (“ASTM D613”), IBR approved for § 1065.703(b).

(8) ASTM D910–13a, Standard Specification for Aviation Gasolines, approved December 1, 2013 (“ASTM D910”), IBR approved for § 1065.701(f).

(9) ASTM D975–13a, Standard Specification for Diesel Fuel Oils, approved December 1, 2013 (“ASTM D975”), IBR approved for § 1065.701(f).

(10) ASTM D1267–12, Standard Test Method for Gage Vapor Pressure of Liquefied Petroleum (LP) Gases (LP-Gas Method), approved November 1, 2012 (“ASTM D1267”), IBR approved for § 1065.720(a).

(11) ASTM D1319–13, Standard Test Method for Hydrocarbon Types in Liquid Petroleum Products by Fluorescent Indicator Adsorption, approved May 1, 2013 (“ASTM D1319”), IBR approved for § 1065.710(c).

(12) ASTM D1655–13a, Standard Specification for Aviation Turbine Fuels, approved December 1, 2013 (“ASTM D1655”), IBR approved for § 1065.701(f).

(13) ASTM D1837–11, Standard Test Method for Volatility of Liquefied Petroleum (LP) Gases, approved October 1, 2011 (“ASTM D1837”), IBR approved for § 1065.720(a).

(14) ASTM D1838–12a, Standard Test Method for Copper Strip Corrosion by Liquefied Petroleum (LP) Gases, approved December 1, 2012 (“ASTM D1838”), IBR approved for § 1065.720(a).

(15) ASTM D1945–03 (Reapproved 2010), Standard Test Method for Analysis of Natural Gas by Gas Chromatography, approved January 1, 2010 (“ASTM D1945”), IBR approved for § 1065.715(a).

(16) ASTM D2158–11, Standard Test Method for Residues in Liquefied Petroleum (LP) Gases, approved January 1, 2011 (“ASTM D2158”), IBR approved for § 1065.720(a).

(17) ASTM D2163–07, Standard Test Method for Determination of Hydrocarbons in Liquefied Petroleum (LP) Gases and Propane/Propene Mixtures by Gas Chromatography, approved December 1, 2007 (“ASTM D2163”), IBR approved for § 1065.720(a).

(18) ASTM D2598–12, Standard Practice for Calculation of Certain Physical Properties of Liquefied Petroleum (LP) Gases from Compositional Analysis, approved November 1, 2012 (“ASTM D2598”), IBR approved for § 1065.720(a).

(19) ASTM D2622–10, Standard Test Method for Sulfur in Petroleum Products by Wavelength Dispersive X-ray Fluorescence Spectrometry, approved February 15, 2010 (“ASTM D2622”), IBR approved for §§ 1065.703(b) and 1065.710(b) and (c).

(20) ASTM D2699–13b, Standard Test Method for Research Octane Number of Spark-Ignition Engine Fuel, approved October 1, 2013 (“ASTM D2699”), IBR approved for § 1065.710(b).

(21) ASTM D2700–13b, Standard Test Method for Motor Octane Number of Spark-Ignition Engine Fuel, approved October 1, 2013 (“ASTM D2700”), IBR approved for § 1065.710(b).

(22) ASTM D2713–13, Standard Test Method for Dryness of Propane (Valve Freeze Method), approved October 1, 2013 (“ASTM D2713”), IBR approved for § 1065.720(a).

(23) ASTM D2784–11, Standard Test Method for Sulfur in Liquefied Petroleum Gases (Oxy-Hydrogen Burner or Lamp), approved January 1, 2011 (“ASTM D2784”), IBR approved for § 1065.720(a).

(24) ASTM D2880–13b, Standard Specification for Gas Turbine Fuel Oils, approved November 15, 2013 (“ASTM D2880”), IBR approved for § 1065.701(f).

(25) ASTM D2986–95a, Standard Practice for Evaluation of Air Assay Media by the Monodisperse DOP (Diocetyl Phthalate) Smoke Test, approved September 10, 1995 (“ASTM D2986”), IBR approved for § 1065.170(c). (Note: This standard was withdrawn by ASTM.)

(26) ASTM D3231–13, Standard Test Method for Phosphorus in Gasoline, approved June 15, 2013 (“ASTM D3231”), IBR approved for § 1065.710(b) and (c).

(27) ASTM D3237–12, Standard Test Method for Lead in Gasoline By Atomic Absorption Spectroscopy, approved June 1, 2012 (“ASTM D3237”), IBR approved for § 1065.710(b) and (c).

(28) ASTM D4052–11, Standard Test Method for Density, Relative Density, and API Gravity of Liquids by Digital Density Meter, approved October 15, 2011 (“ASTM D4052”), IBR approved for § 1065.703(b).

(29) ASTM D4629–12, Standard Test Method for Trace Nitrogen in Liquid Petroleum Hydrocarbons by Syringe/Inlet Oxidative Combustion and Chemiluminescence Detection, approved April 15, 2012 (“ASTM D4629”), IBR approved for § 1065.655(e).

(30) ASTM D4814–13b, Standard Specification for Automotive Spark-Ignition Engine Fuel, approved December 1, 2013 (“ASTM D4814”), IBR approved for § 1065.701(f).

(31) ASTM D4815–13, Standard Test Method for Determination of MTBE, ETBE, TAME, DIPE, tertiary-Amyl Alcohol and C₁ to C₄ Alcohols in Gasoline by Gas Chromatography, approved October 1, 2013 (“ASTM D4815”), IBR approved for § 1065.710(b).

(32) ASTM D5186–03 (Reapproved 2009), Standard Test Method for Determination of the Aromatic Content and Polynuclear Aromatic Content of Diesel Fuels and Aviation Turbine Fuels By Supercritical Fluid Chromatography, approved April 15, 2009 (“ASTM D5186”), IBR approved for § 1065.703(b).

(33) ASTM D5191–13, Standard Test Method for Vapor Pressure of Petroleum Products (Mini Method), approved December 1, 2013 (“ASTM D5191”), IBR approved for § 1065.710(b) and (c).

(34) ASTM D5291–10, Standard Test Methods for Instrumental Determination of Carbon, Hydrogen, and Nitrogen in Petroleum Products and Lubricants, approved May 1, 2010 (“ASTM D5291”), IBR approved for § 1065.655(e).

(35) ASTM D5453–12, Standard Test Method for Determination of Total Sulfur in Light Hydrocarbons, Spark Ignition Engine Fuel, Diesel Engine Fuel, and Engine Oil by Ultraviolet Fluorescence, approved November 1, 2012 (“ASTM D5453”), IBR approved for § 1065.710(b).

(36) ASTM D5599–00 (Reapproved 2010), Standard Test Method for Determination of Oxygenates in Gasoline by Gas Chromatography and Oxygen Selective Flame Ionization Detection, approved October 1, 2010 (“ASTM D5599”), IBR approved for §§ 1065.655(e) and 1065.710(b).

(37) ASTM D5762–12 Standard Test Method for Nitrogen in Petroleum and Petroleum Products by Boat-Inlet Chemiluminescence, approved April 15, 2012 (“ASTM D5762”), IBR approved for § 1065.655(e).

(38) ASTM D5769–10, Standard Test Method for Determination of Benzene, Toluene, and Total Aromatics in Finished Gasolines by Gas Chromatography/Mass Spectrometry, approved May 1, 2010 (“ASTM D5769”), IBR approved for § 1065.710(b).

(39) ASTM D5797–13, Standard Specification for Fuel Methanol (M70- M85)

for Automotive Spark-Ignition Engines, approved June 15, 2013 (“ASTM D5797”), IBR approved for § 1065.701(f).

(40) ASTM D5798–13a, Standard Specification for Ethanol Fuel Blends for Flexible Fuel Automotive Spark-Ignition Engines, approved June 15, 2013 (“ASTM D5798”), IBR approved for § 1065.701(f).

(41) ASTM D6348–12^{e1}, Standard Test Method for Determination of Gaseous Compounds by Extractive Direct Interface Fourier Transform Infrared (FTIR) Spectroscopy, approved February 1, 2012 (“ASTM D6348”), IBR approved for §§ 1065.266(b) and 1065.275(b).

(42) ASTM D6550–10, Standard Test Method for Determination of Olefin Content of Gasolines by Supercritical-Fluid Chromatography, approved October 1, 2010 (“ASTM D6550”), IBR approved for § 1065.710(b).

(43) ASTM D6615–11a, Standard Specification for Jet B Wide-Cut Aviation Turbine Fuel, approved October 1, 2011 (“ASTM D6615”), IBR approved for § 1065.701(f).

(44) ASTM D6751–12, Standard Specification for Biodiesel Fuel Blend Stock (B100) for Middle Distillate Fuels, approved August 1, 2012 (“ASTM D6751”), IBR approved for § 1065.701(f).

(45) ASTM D6985–04a, Standard Specification for Middle Distillate Fuel Oil—Military Marine Applications, approved November 1, 2004 (“ASTM D6985”), IBR approved for § 1065.701(f). (Note: This standard was withdrawn by ASTM.)

(46) ASTM D7039–13, Standard Test Method for Sulfur in Gasoline, Diesel Fuel, Jet Fuel, Kerosine, Biodiesel, Biodiesel Blends, and Gasoline-Ethanol Blends by Monochromatic Wavelength Dispersive X-ray Fluorescence Spectrometry, approved September 15, 2013 (“ASTM D7039”), IBR approved for § 1065.710(b).

(47) ASTM F1471–09, Standard Test Method for Air Cleaning Performance of a High-Efficiency Particulate Air Filter System, approved March 1, 2009 (“ASTM F1471”), IBR approved for § 1065.1001.

* * * * *

(e) *ISO material.* The following standards are available from the International Organization for Standardization, 1, ch. de la Voie-Creuse, CP 56, CH–1211 Geneva 20, Switzerland, 41–22–749–01–11, or <http://www.iso.org>:

(1) ISO 2719:2002, Determination of flash point—Pensky-Martens closed cup method (“ISO 2719”), IBR approved for § 1065.705(c).

(2) ISO 3016:1994, Petroleum products—Determination of pour point (“ISO 3016”), IBR approved for § 1065.705(c).

(3) ISO 3104:1994/Cor 1:1997, Petroleum products—Transparent and opaque liquids—Determination of kinematic viscosity and calculation of dynamic viscosity (“ISO 3104”), IBR approved for § 1065.705(c).

(4) ISO 3675:1998, Crude petroleum and liquid petroleum products—Laboratory determination of density—Hydrometer method (“ISO 3675”), IBR approved for § 1065.705(c).

(5) ISO 3733:1999, Petroleum products and bituminous materials—Determination of water—Distillation method (“ISO 3733”), IBR approved for § 1065.705(c).

(6) ISO 6245:2001, Petroleum products—Determination of ash (“ISO 6245”), IBR approved for § 1065.705(c).

(7) ISO 8217:2012(E), Petroleum products—Fuels (class F)—Specifications of marine fuels, Fifth edition, August 15, 2012 (“ISO 8217”), IBR approved for § 1065.705(b) and (c).

(8) ISO 8754:2003, Petroleum products—Determination of sulfur content—Energy-dispersive X-ray Fluorescence spectrometry (“ISO 8754”), IBR approved for § 1065.705(c).

(9) ISO 10307-2(E):2009, Petroleum products—Total sediment in residual fuel oils—Part 2: Determination using standard procedures for ageing, Second Ed., February 1, 2009 (“ISO 10307”), as modified by ISO 10307-2:2009/Cor.1:2010(E), Technical Corrigendum 1, published May 15, 2010, IBR approved for § 1065.705(c).

(10) ISO 10370:1993/Cor 1:1996, Petroleum products—Determination of carbon residue—Micro method (“ISO 10370”), IBR approved for § 1065.705(c).

(11) ISO 10478:1994, Petroleum products—Determination of aluminium and silicon in fuel oils—Inductively coupled plasma emission and atomic absorption spectroscopy methods (“ISO 10478”), IBR approved for § 1065.705(c).

(12) ISO 12185:1996/Cor 1:2001, Crude petroleum and petroleum products—Determination of density—Oscillating U-tube method (“ISO 12185”), IBR approved for § 1065.705(c).

(13) ISO 14596:2007, Petroleum products—Determination of sulfur content—Wavelength-dispersive X-ray fluorescence spectrometry (“ISO 14596”), IBR approved for § 1065.705(c).

(14) ISO 14597:1997, Petroleum products—Determination of vanadium and nickel content—Wavelength dispersive X-ray fluorescence spectrometry (“ISO 14597”), IBR approved for § 1065.705(c).

(15) ISO 14644-1:1999, Cleanrooms and associated controlled environments (“ISO 14644”), IBR approved for § 1065.190(b).

* * * * *

Subpart L—Methods for Unregulated and Special Pollutants

■ 280. Section 1065.1105 is amended by revising paragraphs (a) and (c)(4) to read as follows:

§ 1065.1105 Sampling system design.

(a) *General.* We recommend that you design your SVOC batch sampler to extract sample from undiluted emissions to maximize the sampled SVOC quantity. If you dilute your sample, we recommend using annular dilution. If you dilute your sample, but do not use annular dilution, you must precondition your sampling system to reach equilibrium with respect to loss and re-entrainment of SVOCs to the walls of the sampling system. To the

extent practical, adjust sampling times based on the emission rate of target analytes from the engine to obtain analyte concentrations above the detection limit. In some instances you may need to run repeat test cycles without replacing the sample media or disassembling the batch sampler.

* * * * *

(c) * * *

(4) Use a hydrophobic sorbent in a sealed sorbent module. Note that this sorbent module is intended to be the final stage for collecting the SVOC sample and should be sized accordingly. We recommend sizing the module to hold 40 g of XAD-2 along with PUF plugs at either end of the module, noting that you may vary the mass of XAD used for testing based on the anticipated SVOC emission concentration and sample flow rate.

* * * * *

■ 281. Section 1065.1107 is amended by revising paragraphs (a)(1), (a)(2), and (b) introductory text to read as follows:

§ 1065.1107 Sample media and sample system preparation; sample system assembly.

* * * * *

(a) * * *

(1) For capturing PM, we recommend using pure quartz filters with no binder if you are not analyzing separately for SVOCs in gas and particle phases. If you are analyzing separately, you must use polytetrafluoroethylene (PTFE) filters with PTFE support. Select the filter diameter to minimize filter change intervals, accounting for the expected PM emission rate, sample flow rate. Note that when repeating test cycles to increase sample mass, you may replace the filter without replacing the sorbent or otherwise disassembling the batch sampler. In those cases, include all filters in the extraction.

(2) For capturing gaseous SVOCs, utilize XAD-2 resin with or without PUF plugs. Note that two PUF plugs are typically used to contain the XAD-2 resin in the sorbent module.

(b) *Sample media and sampler preparation.* Prepare pre-cleaned PM filters and pre-cleaned PUF plugs/XAD-2 as needed. Store sample media in containers protected from light and ambient air if you do not use them immediately after cleaning. Use the following preparation procedure, or an analogous procedure with different solvents and extraction times:

* * * * *

■ 282. Section 1065.1109 is amended by revising paragraphs (a)(1) and (b)(4) introductory text to read as follows:

§ 1065.1109 Post-test sampler disassembly and sample extraction.

* * * * *

(a) * * *

(1) Remove the PM filter, PUF plugs, and all the XAD-2 from the sampling system and store them at or below 5 °C until analysis.

* * * * *

(b) * * *

(4) After completing the initial extraction, remove the solvent and concentrate it to (4.0 ± 0.5) ml using a Kuderna-Danish concentrator that includes a condenser such as a three-ball Snyder column with venting dimples and a graduated collection tube. Hold the water bath temperature at (75 to 80) °C. Using this concentrator will minimize evaporative loss of analytes with lower molecular weight.

* * * * *

PART 1066—VEHICLE-TESTING PROCEDURES

■ 283. The authority citation for part 1066 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart B—Equipment, Measurement Instruments, Fuel, and Analytical Gas Specifications

■ 284. Section 1066.105 is amended by revising paragraphs (c)(2) introductory text, (c)(2)(i), (c)(2)(iv), (c)(2)(v), (c)(5)(i), (c)(5)(iii), and (d) to read as follows:

§ 1066.105 Ambient controls and vehicle cooling fans.

* * * * *

(c) * * *

(2) You may use a road-speed modulated fan system meeting the specifications of this paragraph (c)(2) for anything other than SC03 and AC17 testing. Use a road-speed modulated fan that achieves a linear speed of cooling air at the blower outlet that is within ±3.0 mi/hr (±1.3 m/s) of the corresponding roll speed when vehicle speeds are between 5 and 30 mi/hr, and within ±6.5 mi/hr (±2.9 m/s) of the corresponding roll speed at higher vehicle speeds; however you may limit the fan's maximum linear speed to 70 mi/hr. We recommend that the cooling fan have a minimum opening of 0.2 m² and a minimum width of 0.8 m.

(i) Verify the air flow velocity for fan speeds corresponding to vehicle speeds of 20 and 40 mi/hr using an instrument that has an accuracy of ±2% of the measured air flow speed.

* * * * *

(iv) Verify that the uniformity of the fan's axial flow is constant across the discharge area within a tolerance of ±4.0

mi/hr of the vehicle's speed at fan speeds corresponding to 20 mi/hr, and within ± 8.0 mi/hr at fan speeds corresponding to 40 mi/hr. For example, at a vehicle speed of 20.2 mi/hr, axial flow at all locations denoted by the "+" across the discharge nozzle must be between 16.2 and 24.2 mi/hr. When measuring the axial air flow velocity, use good engineering judgment to determine the distance from the nozzle outlet at each point of the fan outlet grid. Use these values to calculate a mean air flow velocity across the discharge area at each speed setting. The instrument used to verify the air velocity must have an accuracy of $\pm 2\%$ of the measured air flow velocity.

(v) Use a multi-axis flow meter or another method to verify that the fan's air flow perpendicular to the axial air flow is less than 15% of the axial air flow, consistent with good engineering judgment. Demonstrate this by comparing the perpendicular air flow velocity to the mean air flow velocities determined in paragraph (c)(2)(iv) of this section at vehicle speeds of 20 and 40 mi/hr.

* * * * *

(5) * * *

(i) Air flow volumes must be proportional to vehicle speed. Select a fan size that will produce a flow volume of approximately 45 m³/s at 60 mi/hr. If this fan is also the only source of test cell air circulation or if fan operational mechanics make the 0 mi/hr air flow requirement impractical, air flow of 2 mi/hr or less at 0 mi/hr vehicle speed is allowed.

* * * * *

(iii) Use a multi-axis flow meter or another method to verify that the fan's air flow perpendicular to the axial air flow is less than 10% of the axial air flow, consistent with good engineering judgment. Demonstrate this by comparing the perpendicular air flow velocity to the mean air flow velocities determined in paragraph (c)(2)(iv) of this section at vehicle speeds of 20 and 40 mi/hr.

* * * * *

(d) *Allowable cooling fans for vehicles above 14,000 pounds GVWR.* For all testing, use a road-speed modulated fan system that achieves a linear speed of cooling air at the blower outlet that is within ± 3.0 mi/hr (± 1.3 m/s) of the corresponding roll speed when vehicle speeds are between 5 and 30 mi/hr, and within ± 10 mi/hr (± 4.5 m/s) of the corresponding roll speed at higher vehicle speeds. For vehicles above 19,500 pounds GVWR, we recommend that the cooling fan have a minimum opening of 2.75 m², a minimum flow rate of 60 m³/s at a fan speed of 50 mi/hr, and a minimum speed profile in the free stream flow, across the duct that is $\pm 15\%$ of the target flow rate.

■ 285. Section 1066.110 is amended as follows:

■ a. By revising paragraph (b)(1)(i).

■ b. By redesignating paragraphs (b)(1)(ii) through (vii) as paragraphs (b)(1)(iii) through (viii), respectively.

■ c. By adding a new paragraph (b)(1)(ii).

■ d. By revising newly redesignated paragraph (b)(1)(vii).

■ e. By revising paragraph (b)(2)(i)(B).

■ f. By adding paragraph (b)(2)(iii)(C).

■ g. By revising paragraph (c).

The additions and revisions read as follows:

§ 1066.110 Equipment specifications for emission sampling systems.

* * * * *

(b) * * *

(1) * * *

(i) Minimize lengths of laboratory exhaust tubing. You may use a total length of laboratory exhaust tubing up to 4 m without needing to heat or insulate the tubing. However, you may use a total length of laboratory exhaust tubing up to 10 m, or up to 15 m for samples not involving PM measurement, if you insulate and/or heat the tubing to minimize the temperature difference between the exhaust gas and the whole tubing wall over the course of the emission test. The laboratory exhaust tubing starts at the end of the vehicle's tailpipe and ends at the first sample point or the first

dilution point. The laboratory exhaust tubing may include flexible sections, but we recommend that you limit the amount of flexible tubing to the extent practicable. For multiple-tailpipe configurations where the tailpipes combine into a single flow path for emission sampling, the start of the laboratory exhaust tubing may be taken at the last joint where the exhaust flow first becomes a single, combined flow.

(ii) For vehicles above 14,000 pounds GVWR, you may shorten the tailpipe up to the outlet of the last aftertreatment device or silencer, whichever is furthest downstream.

* * * * *

(vii) Electrically ground the entire exhaust system, with the exception of nonconductive flexible tubing, as allowed under paragraph (b)(1)(iv) of this section.

(2) * * *

(i) * * *

(B) You may sample background PM from the dilution tunnel at any time before or after an emission test using the same sampling system used during the emission test. For this background sampling, the dilution tunnel blower must be turned on, the vehicle must be disconnected from the laboratory exhaust tubing, and the laboratory exhaust tubing must be capped. You may run this PM blank test in combination with the dilute exhaust flow verification (propane check) in 40 CFR 1065.341, as long as the exhaust tubing inlet to the CVS has a filter meeting the requirements of 40 CFR 1065.140(b)(3).

* * * * *

(iii) * * *

(C) You may use a higher target filter face velocity as specified in 40 CFR 1065.170(c)(1)(vi), up to 140 cm/s, if you need to increase filter loading for PM measurement.

* * * * *

(c) The following table summarizes the requirements of paragraph (b)(2) of this section:

TABLE 1 OF § 1066.110—SUMMARY OF EQUIPMENT SPECIFICATIONS FROM 40 CFR PART 1065, SUBPART B, THAT APPLY FOR CHASSIS TESTING

40 CFR part 1065 references	Applicability for chassis testing under this part
40 CFR 1065.140	Use all except as noted: 40 CFR 1065.140(b) applies as described in this section. Use 40 CFR 1065.140(c)(6), with the additional allowance described in this section. Do not use 40 CFR 1065.140(d)(2)(iv). Use 40 CFR 1065.140(e)(1) as described in this section. Do not use 40 CFR 1065.140(e)(2).
40 CFR 1065.145	Use all except 40 CFR 1065.145(b).
40 CFR 1065.150	Use all.

TABLE 1 OF § 1066.110—SUMMARY OF EQUIPMENT SPECIFICATIONS FROM 40 CFR PART 1065, SUBPART B, THAT APPLY FOR CHASSIS TESTING—Continued

40 CFR part 1065 references	Applicability for chassis testing under this part
40 CFR 1065.170	Use all except as noted: Use 40 CFR 1065.170(c)(1)(vi) as described in this section.
40 CFR 1065.190	Use all.

■ 286. Section 1066.135 is amended by revising paragraph (d)(1) to read as follows:

§ 1066.135 Linearity verification.

* * * * *

(d) * * *

(1) Raw exhaust static pressure control.

* * * * *

■ 287. Section 1066.140 is amended as follows:

■ a. By revising paragraphs (e), (f)(6)(i), (f)(8), (f)(13), (g)(6)(i), (g)(11), (h) introductory text, (h)(6)(i), (h)(7), (h)(9), and (h)(10).

■ b. By redesignating paragraph (j) as paragraph (i).

■ c. By revising Figure 1.

The revisions read as follows:

§ 1066.140 Diluted exhaust flow calibration.

* * * * *

(e) *Configuration*. Calibrate the system with any upstream screens or other restrictions that will be used during testing and that could affect the flow ahead of the flow meter. You may not use any upstream screen or other restriction that could affect the flow ahead of the reference flow meter, unless the flow meter has been calibrated with such a restriction.

(f) * * *

(6) * * *

(i) The mean flow rate of the reference flow meter, \bar{V}_{ref} . This may include several measurements of different quantities, such as reference meter pressures and temperatures, for calculating \bar{V}_{ref} .

* * * * *

(8) Repeat the steps in paragraphs (f)(6) and (7) of this section to record data at a minimum of six restrictor positions ranging from the wide-open restrictor position to the minimum expected pressure at the PDP inlet or the maximum expected differential (outlet minus inlet) pressure across the PDP during testing.

* * * * *

(13) During emission testing ensure that the PDP is not operated either below the lowest inlet pressure point or above the highest differential pressure point in the calibration data.

(g) * * *

(6) * * *

(i) The mean flow rate of the reference flow meter, \bar{V}_{ref} . This may include several measurements of different quantities for calculating \bar{V}_{ref} , such as reference meter pressures and temperatures.

* * * * *

(11) Use the SSV only between the minimum and maximum calibrated $Re^{\#}$. If you want to use the SSV at a lower

or higher $Re^{\#}$, you must recalibrate the SSV.

* * * * *

(h) *CFV calibration*. The calibration procedure described in this paragraph (h) establishes the value of the calibration coefficient, K_v , at measured values of pressure, temperature and air flow. Calibrate the CFV up to the highest expected pressure ratio, r , according to § 1066.625. Calibrate the CFV as follows:

(6) * * *

(i) The mean flow rate of the reference flow meter, \bar{V}_{ref} . This may include several measurements of different quantities, such as reference meter pressures and temperatures, for calculating \bar{V}_{ref} .

* * * * *

(7) Incrementally close the restrictor valve or decrease the downstream pressure to decrease the differential pressure across the CFV, Δp_{CFV} .

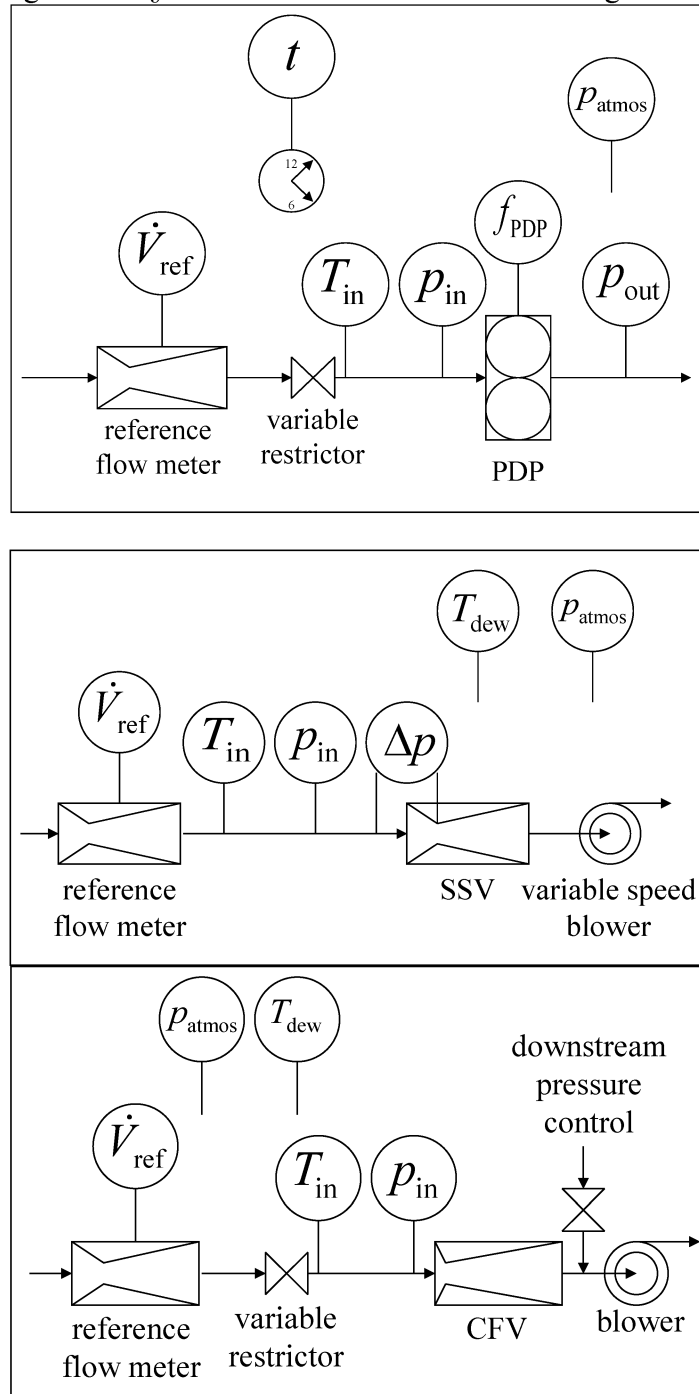

* * * * *

(9) Determine K_v and the highest allowable pressure ratio, r , according to § 1066.625.

(10) Use K_v to determine CFV flow during an emission test. Do not use the CFV above the highest allowed r , as determined in § 1066.625.

* * * * *

Figure 1 of § 1066.140—CVS calibration configurations

Subpart C—Dynamometer Specifications

■ 288. Section 1066.210 is amended by revising paragraph (d)(3) to read as follows:

§ 1066.210 Dynamometers.

* * * * *

(d) * * *

(3) The load applied by the dynamometer simulates forces acting on

the vehicle during normal driving according to the following equation:

$$FR_i = A \cdot \frac{100}{\sqrt{100^2 + G_i^2}} + B \cdot v_i + C \cdot v_i^2 + M_e \cdot \frac{v_i - v_{i-1}}{t_i - t_{i-1}} + M \cdot a_g \cdot \frac{G_i}{\sqrt{100^2 + G_i^2}}$$

Eq. 1066.210-1

Where:

FR = total road-load force to be applied at the surface of the roll. The total force is the sum of the individual tractive forces applied at each roll surface.

i = a counter to indicate a point in time over the driving schedule. For a dynamometer operating at 10 Hz intervals over a 600 second driving schedule, the maximum value of i should be 6,000.

A = a vehicle-specific constant value representing the vehicle's frictional load in lbf or newtons. See subpart D of this part.

G_i = instantaneous road grade, in percent. If your duty cycle is not subject to road grade, set this value to 0.

B = a vehicle-specific coefficient representing load from drag and rolling resistance, which are a function of vehicle speed, in

lbf/(mi/hr) or N·s/m. See subpart D of this part.

v = instantaneous linear speed at the roll surfaces as measured by the dynamometer, in mi/hr or m/s. Let $v_{i-1} = 0$ for $i = 0$.

C = a vehicle-specific coefficient representing aerodynamic effects, which are a function of vehicle speed squared, in lbf/(mi/hr)² or N·s²/m². See subpart D of this part.

M_e = the vehicle's effective mass in lbm or kg, including the effect of rotating axles as specified in § 1066.310(b)(7).

t = elapsed time in the driving schedule as measured by the dynamometer, in seconds. Let $t_{i-1} = 0$ for $i = 0$.

M = the measured vehicle mass, in lbm or kg.

a_g = acceleration of Earth's gravity, as described in 40 CFR 1065.630.

* * * * *

■ 289. Section 1066.235 is amended by revising paragraphs (c)(1)(i) and (c)(2)(i) to read as follows:

§ 1066.235 Speed verification procedure.

* * * * *

(c) * * *

(1) * * *

(i) Set the dynamometer to speed-control mode. Set the dynamometer speed to a value of approximately 4.5 m/s (10 mi/hr); record the output of the frequency counter after 10 seconds. Determine the roll speed, v_{act} , using the following equation:

$$v_{act} = \frac{f \cdot d_{roll} \cdot \pi}{n}$$

Eq. 1066.235-1

Where:

f = frequency of the dynamometer speed sensing device, accurate to at least four significant figures.

d_{roll} = nominal roll diameter, accurate to the nearest 1.0 mm, consistent with § 1066.225(d).

n = the number of pulses per revolution from the dynamometer roll speed sensor.

Example:

$f = 2.9231 \text{ Hz} = 2.9231 \text{ s}^{-1}$

$d_{roll} = 904.40 \text{ mm} = 0.90440 \text{ m}$

$$v_{act} = \frac{2.9231 \cdot 0.90440 \cdot \pi}{1}$$

$v_{act} = 8.3053 \text{ m/s}$

* * * * *

(2) * * *

(i) Set the dynamometer to speed-control mode. Set the dynamometer speed to a speed value of approximately 4.5 m/s (10 mi/hr). Tune the stroboscope or photo tachometer until the signal matches the dynamometer roll speed. Record the frequency. Determine the roll speed, v_{act} , using Eq. 1066.235-1, using the stroboscope or photo tachometer's frequency for f .

* * * * *

■ 290. Section 1066.245 is amended by revising paragraph (c) introductory text to read as follows:

§ 1066.245 Response time verification.

* * * * *

(c) *Procedure.* Use the dynamometer's automated process to verify response time. You may perform this test either

at two different inertia settings corresponding approximately to the minimum and maximum vehicle weights you expect to test or using base inertia and two acceleration rates that cover the range of acceleration rates experienced during testing (such as 0.5 and 8 (mi/hr)/s). Use good engineering judgment to select road-load coefficients representing vehicles of the appropriate weight. Determine the dynamometer's settling response time, t_s , based on the point at which there are no measured results more than 10% above or below the final equilibrium value, as illustrated in Figure 1 of this section. The observed settling response time must be less than 100 milliseconds for each inertia setting. Figure 1 follows:

* * * * *

■ 291. Section 1066.250 is amended by revising paragraphs (c)(1), (c)(2), and (c)(5) to read as follows:

§ 1066.250 Base inertia verification.

* * * * *

(c) * * *

(1) Warm up the dynamometer according to the dynamometer manufacturer's instructions. Set the dynamometer's road-load inertia to zero, turning off any electrical simulation of road load and inertia so that the base inertia of the dynamometer is the only inertia present. Motor the rolls to 5 mi/hr. Apply a constant force to accelerate the roll at a nominal rate of 1 (mi/hr)/s. Measure the elapsed time to accelerate from 10 to 40 mi/hr, noting the corresponding speed and time points to the nearest 0.01 mi/hr and 0.01 s. Also determine mean force over the measurement interval.

(2) Starting from a steady roll speed of 45 mi/hr, apply a constant force to the roll to decelerate the roll at a nominal rate of 1 mi/hr/s. Measure the elapsed time to decelerate from 40 to 10 mi/hr, noting the corresponding speed and time points to the nearest 0.01 mi/hr and 0.01 s. Also determine mean force over the measurement interval.

* * * * *

(5) Determine the base inertia, I_b , for each measurement interval using the following equation:

$$I_b = \frac{\bar{F}}{\left| \frac{v_{\text{final}} - v_{\text{init}}}{\Delta t} \right|}$$

Eq. 1066.250-1

Where:

\bar{F} = mean dynamometer force over the measurement interval as measured by the dynamometer.

v_{final} = roll surface speed at the end of the measurement interval to the nearest 0.01 mi/hr.

v_{init} = roll surface speed at the start of the measurement interval to the nearest 0.01 mi/hr.

Δt = elapsed time during the measurement interval to the nearest 0.01 s.

Example:

$\bar{F} = 1.500 \text{ lbf} = 48.26 \text{ ft}\cdot\text{lbm/s}^2$

$v_{\text{final}} = 40.00 \text{ mi/hr} = 58.67 \text{ ft/s}$

$v_{\text{init}} = 10.00 \text{ mi/hr} = 14.67 \text{ ft/s}$

$\Delta t = 30.00 \text{ s}$

$$I_b = \frac{48.26}{\left| \frac{58.67 - 14.67}{30.00} \right|}$$

$I_b = 32.90 \text{ lbm}$

* * * * *

■ 292. Section 1066.260 is amended by revising paragraphs (c)(3) and (4) to read as follows:

§ 1066.260 Parasitic friction compensation evaluation.

* * * * *

(c) * * *

(3) Set the dynamometer inertia to the base inertia with the road-load coefficients A, B, and C set to 0. Set the dynamometer to speed-control mode with a target speed of 50 mi/hr or a higher speed recommended by the dynamometer manufacturer. Once the speed stabilizes at the target speed, switch the dynamometer from speed-control to torque-control and allow the roll to coast for 60 seconds. Record the initial and final speeds and the corresponding start and stop times. If friction compensation is executed

perfectly, there will be no change in speed during the measurement interval.

(4) Calculate the power equivalent of friction compensation error, FC_{error} , using the following equation:

$$FC_{\text{error}} = \frac{I}{2 \cdot t} \cdot (v_{\text{init}}^2 - v_{\text{final}}^2)$$

Eq. 1066.260-1

Where:

I = dynamometer inertia setting.

t = duration of the measurement interval, accurate to at least 0.01 s.

v_{init} = the roll speed corresponding to the start of the measurement interval, accurate to at least 0.05 mi/hr.

v_{final} = the roll speed corresponding to the end of the measurement interval, accurate to at least 0.05 mi/hr.

Example:

$I = 2000 \text{ lbm} = 62.16 \text{ lbf}\cdot\text{s}^2/\text{ft}$

$t = 60.0 \text{ s}$

$v_{\text{init}} = 9.2 \text{ mi/hr} = 13.5 \text{ ft/s}$

$v_{\text{final}} = 10.0 \text{ mi/hr} = 14.7 \text{ ft/s}$

$$FC_{\text{error}} = \frac{62.16}{2 \cdot 60.00} \cdot (13.5^2 - 14.7^2)$$

$FC_{\text{error}} = -16.5 \text{ ft}\cdot\text{lbf/s} = -0.031 \text{ hp}$

* * * * *

■ 293. Section 1066.265 is amended by revising paragraphs (c) and (d) to read as follows:

§ 1066.265 Acceleration and deceleration verification.

* * * * *

(c) *Verification of acceleration and deceleration rates.* Activate the dynamometer's function generator for measuring roll revolution frequency. If the dynamometer has no such function generator, set up a properly calibrated external function generator consistent with the verification described in this paragraph (c). Use the function generator to determine actual acceleration and deceleration rates as the dynamometer traverses speeds between 10 and 40 mi/hr at various nominal acceleration and deceleration rates. Verify the dynamometer's acceleration and deceleration rates as follows:

(1) Set up start and stop frequencies specific to your dynamometer by identifying the roll-revolution frequency, f , in revolutions per second (or Hz) corresponding to 10 mi/hr and 40 mi/hr vehicle speeds, accurate to at least four significant figures, using the following equation:

$$f = \frac{v \cdot n}{d_{\text{roll}} \cdot \pi}$$

Eq. 1066.265-1

Where:

v = the target roll speed, in inches per second (corresponding to drive speeds of 10 mi/hr or 40 mi/hr).

n = the number of pulses from the dynamometer's roll-speed sensor per roll revolution.

d_{roll} = roll diameter, in inches.

(2) Program the dynamometer to accelerate the roll at a nominal rate of 1 mi/hr/s from 10 mi/hr to 40 mi/hr. Measure the elapsed time to reach the target speed, to the nearest 0.01 s. Repeat this measurement for a total of five runs. Determine the actual acceleration rate for each run, a_{act} , using the following equation:

$$a_{\text{act}} = \frac{v_{\text{final}} - v_{\text{init}}}{t}$$

Eq. 1066.265-2

Where:

a_{act} = acceleration rate (decelerations have negative values).

v_{final} = the target value for the final roll speed.

v_{init} = the setpoint value for the initial roll speed.

t = time to accelerate from v_{init} to v_{final} .

Example:

$v_{\text{final}} = 40 \text{ mi/hr}$

$v_{\text{init}} = 10 \text{ mi/hr}$

$t = 30.003 \text{ s}$

$$a_{\text{act}} = \frac{40.00 - 10.00}{30.03}$$

$a_{\text{act}} = 0.999 \text{ (mi/hr)/s}$

(3) Program the dynamometer to decelerate the roll at a nominal rate of 1 (mi/hr)/s from 40 mi/hr to 10 mi/hr. Measure the elapsed time to reach the target speed, to the nearest 0.01 s. Repeat this measurement for a total of five runs. Determine the actual acceleration rate, a_{act} , using Eq. 1066.265-2.

(4) Repeat the steps in paragraphs (c)(2) and (3) of this section for additional acceleration and deceleration rates in 1 (mi/hr)/s increments up to and including one increment above the maximum acceleration rate expected during testing. Average the five repeat runs to calculate a mean acceleration rate, \bar{a}_{act} , at each setting.

(5) Compare each mean acceleration rate, \bar{a}_{act} , to the corresponding nominal acceleration rate, a_{ref} , to determine values for acceleration error, a_{error} , using the following equation:

$$a_{\text{error}} = \frac{\bar{a}_{\text{act}} - a_{\text{ref}}}{a_{\text{ref}}} \cdot 100 \%$$

Eq. 1066.265-3

Example:

$$\bar{a}_{\text{act}} = 0.999 \text{ (mi/hr)/s}$$

$$a_{\text{ref}} = 1 \text{ (mi/hr)/s}$$

$$a_{\text{error}} = \frac{0.999 - 1}{1} \cdot 100 \%$$

$$a_{\text{error}} = -0.100 \%$$

(d) *Verification of forces for controlling acceleration and deceleration.* Program the dynamometer with a calculated force value and determine actual acceleration and deceleration rates as the dynamometer traverses speeds between 10 and 40 mi/hr at various nominal acceleration and deceleration rates. Verify the dynamometer's ability to achieve certain acceleration and deceleration rates with a given force as follows:

(1) Calculate the force setting, F , using the following equation:

$$F = I_b \cdot |a|$$

$$\text{Eq. 1066.265-4}$$

Where:

I_b = the dynamometer manufacturer's stated base inertia, in lbf-s²/ft.

a = nominal acceleration rate, in ft/s².

Example:

$$I_b = 2967 \text{ lbm} = 92.217 \text{ lbf-s}^2/\text{ft}$$

$$a = 1 \text{ (mi/hr)/s} = 1.4667 \text{ ft/s}^2$$

$$F = 92.217 - 1.4667$$

$$F = 135.25 \text{ lbf}$$

(2) Set the dynamometer to road-load mode and program it with a calculated force to accelerate the roll at a nominal rate of 1 (mi/hr)/s from 10 mi/hr to 40 mi/hr. Measure the elapsed time to reach the target speed, to the nearest 0.01 s. Repeat this measurement for a total of five runs. Determine the actual acceleration rate, a_{act} , for each run using Eq. 1066.265-2. Repeat this step to determine measured "negative acceleration" rates using a calculated force to decelerate the roll at a nominal rate of 1 (mi/hr)/s from 40 mi/hr to 10 mi/hr. Average the five repeat runs to calculate a mean acceleration rate, \bar{a}_{act} , at each setting.

(3) Repeat the steps in paragraph (d)(2) of this section for additional acceleration and deceleration rates as specified in paragraph (c)(4) of this section.

(4) Compare each mean acceleration rate, \bar{a}_{act} , to the corresponding nominal acceleration rate, \bar{a}_{ref} , to determine values for acceleration error, \bar{a}_{error} , using Eq. 1066.265-3.

* * * * *

■ 294. Section 1066.270 is amended by revising paragraphs (c)(2), (c)(4), (c)(6) and (d)(1) to read as follows:

§ 1066.270 Unloaded coastdown verification.

* * * * *

(c) * * *

(2) With the dynamometer in coastdown mode, set the dynamometer inertia for the smallest vehicle weight that you expect to test and set A, B, and C road-load coefficients to values typical of those used during testing. Program the dynamometer to coast down over the dynamometer operational speed range (typically from a speed of 80 mi/hr through a minimum speed at or below 10 mi/hr). Perform at least one coastdown run over this speed range, collecting data over each 10 mi/hr interval.

* * * * *

(4) Determine the average coastdown force, \bar{F} , for each speed and inertia setting for each of the coastdowns performed using the following equation:

$$\bar{F} = \frac{I \cdot (v_{\text{init}} - v_{\text{final}})}{t}$$

$$\text{Eq. 1066.270-1}$$

Where:

\bar{F} = the mean force measured during the coastdown for each speed interval and inertia setting, expressed in lbf-s²/ft and rounded to four significant figures.

I = the dynamometer's inertia setting, in lbf-s²/ft.

v_{init} = the speed at the start of the coastdown interval, expressed in ft/s to at least four significant figures.

v_{final} = the speed at the end of the coastdown interval, expressed in ft/s to at least four significant figures.

t = coastdown time for each speed interval and inertia setting, accurate to at least 0.01 s.

Example:

$$I = 2000 \text{ lbm} = 62.16 \text{ lbf-s}^2/\text{ft}$$

$$v_{\text{init}} = 25 \text{ mi/hr} = 36.66 \text{ ft/s}$$

$$v_{\text{final}} = 15 \text{ mi/hr} = 22.0 \text{ ft/s}$$

$$t = 5.00 \text{ s}$$

$$\bar{F} = \frac{62.16 \cdot (36.66 - 22.0)}{5.00}$$

$$\bar{F} = 182.2 \text{ lbf}$$

* * * * *

(6) Compare the mean value of the coastdown force measured for each speed interval and inertia setting, \bar{F}_{act} , to the corresponding F_{ref} to determine values for coastdown force error, F_{error} , using the following equation:

$$F_{\text{error}} = \left| \frac{\bar{F}_{\text{act}} - F_{\text{ref}}}{F_{\text{ref}}} \right| \cdot 100$$

$$\text{Eq. 1066.270-2}$$

Example:

$$F_{\text{ref}} = 192 \text{ lbf}$$

$$\bar{F}_{\text{act}} = 191 \text{ lbf}$$

$$F_{\text{error}} = \left| \frac{191 - 192}{192} \right| \cdot 100$$

$$F_{\text{error}} = 0.5 \%$$

(d) * * *

(1) For vehicles at or below 20,000 pounds GVWR, the maximum allowable error, F_{errormax} , for all speed intervals and inertia settings is 1.0% or the value determined from Eq. 1066.270-3, whichever is greater.

$$F_{\text{errormax}} = \frac{2.2 \text{ lbf}}{F_{\text{ref}}} \cdot 100$$

$$\text{Eq. 1066.270-3}$$

Example:

$$F_{\text{ref}} = 192 \text{ lbf}$$

$$F_{\text{errormax}} = \frac{2.2 \text{ lbf}}{192} \cdot 100$$

$$F_{\text{errormax}} = 1.14 \%$$

* * * * *

■ 295. Section 1066.275 is amended by revising paragraph (c)(1) to read as follows:

§ 1066.275 Daily dynamometer readiness verification.

* * * * *

(c) * * *

(1) With the dynamometer in coastdown mode, set the dynamometer inertia to the base inertia with the road-load coefficient A set to 20 lbf (or a force that results in a coastdown time of less than 10 minutes) and coefficients B and C set to 0. Program the dynamometer to coast down for one 10 mi/hr interval from 55 mi/hr down to 45 mi/hr. If your dynamometer is not capable of performing one discrete coastdown, then coast down with preset 10 mi/hr intervals that include a 55 mi/hr to 45 mi/hr interval.

* * * * *

Subpart D—Coastdown

■ 296. Section 1066.301 is amended by adding introductory text to read as follows:

§ 1066.301 Overview of road-load determination procedures.

Vehicle testing on a chassis dynamometer involves simulating the road-load force, which is the sum of forces acting on a vehicle from aerodynamic drag, tire rolling resistance, driveline losses, and other effects of friction. Determine dynamometer settings to simulate road-

load force in two stages. First, perform a road-load force specification by characterizing on-road operation. Second, perform a road-load derivation to determine the appropriate dynamometer load settings to simulate the road-load force specification from the on-road test.

* * * * *

■ 297. Section 1066.305 is amended by revising paragraph (a) to read as follows:

§ 1066.305 Procedures for specifying road-load forces for motor vehicles at or below 14,000 pounds GVWR.

(a) For motor vehicles at or below 14,000 pounds GVWR, develop representative road-load coefficients to characterize each vehicle covered by a certificate of conformity. Calculate road-load coefficients by performing coastdown tests using the provisions of SAE J1263 and SAE J2263 (incorporated by reference in § 1066.1010). This protocol establishes a procedure for determination of vehicle road load force for speeds between 115 and 15 km/hr (71.5 and 9.3 mi/hr); the final result is a model of road-load force (as a function of speed) during operation on a dry, level road under reference conditions of 20 °C, 98.21 kPa, no wind, no precipitation, and the transmission in neutral. You may use other methods that are equivalent to SAE J2263, such as equivalent test procedures or analytical modeling, to characterize road load using good engineering judgment. Determine dynamometer settings to simulate the road-load profile represented by these road-load target coefficients as described in § 1066.315. Supply representative road-load forces for each vehicle at speeds above 15 km/hr (9.3 mi/hr), and up to 115 km/hr (71.5 mi/hr), or the highest speed from the range of applicable duty cycles.

* * * * *

■ 298. Section 1066.310 is amended by revising the introductory text and paragraphs (b)(1)(i), (b)(2), (b)(6), (b)(7)(ii) introductory text, (b)(7)(ii)(A), (b)(7)(ii)(B), (b)(7)(ii)(D), and (b)(7)(ii)(E) to read as follows:

§ 1066.310 Coastdown procedures for vehicles above 14,000 pounds GVWR.

This section describes coastdown procedures that are unique to vehicles above 14,000 pounds GVWR. These procedures are valid for calculating road-load coefficients for chassis and post-transmission powerpack testing. These procedures are also valid for calculating drag area (C_dA) to demonstrate compliance with Phase 1

greenhouse gas emission standards under 40 CFR part 1037.

* * * * *

(b) * * *

(1) * * *

(i) We recommend that you do not perform coastdown testing on days for which winds are forecast to exceed 6.0 mi/hr.

* * * * *

(2) Operate the vehicle at a top speed above 70 mi/hr, or at its maximum achievable speed if it cannot reach 70 mi/hr. If a vehicle is equipped with a vehicle speed limiter that is set for a maximum speed below 70 mi/hr, you must disable the vehicle speed limiter. Start the test at or above 70 mi/hr, or at the vehicle's maximum achievable speed if it cannot reach 70 mi/hr. Collect data through a minimum speed at or below 15 mi/hr. Data analysis for valid coastdown runs must include the range of vehicle speeds specified in this paragraph (b)(2).

* * * * *

(6) All valid coastdown run times in each direction must be within 2.0 standard deviations of the mean of the valid coastdown run times (from the specified maximum speed down to 15 mi/hr) in that direction. Eliminate runs outside this range. After eliminating these runs you must have at least eight valid runs in each direction. You may use coastdown run times that do not meet these standard deviation requirements if we approve it in advance. In your request, describe why the vehicle is not able to meet the specified standard deviation requirements and propose an alternative set of requirements.

(7) * * *

(ii) Determine drag area, C_dA , as follows instead of using the procedure specified in Section 10 of SAE J1263:

(A) Measure vehicle speed at fixed intervals over the coastdown run (generally at 10 Hz), including speeds at or above 15 mi/hr and at or below the specified maximum speed. Establish the elevation corresponding to each interval as described in SAE J2263 if you need to incorporate the effects of road grade.

(B) Calculate the vehicle's effective mass, M_e , in kg by adding 56.7 kg to the measured vehicle mass, M , for each tire making road contact. This accounts for the rotational inertia of the wheels and tires.

* * * * *

(D) Plot the data from all the coastdown runs on a single plot of F_i vs. v_i^2 to determine the slope correlation, D , based on the following equation:

$$F_i - M \cdot a_g \cdot \frac{\Delta h}{\Delta s} = A_m + D \cdot v_i^2$$

Eq. 1066.310-2

Where:

M = the measured vehicle mass, expressed to at least the nearest 0.1 kg.

a_g = acceleration of Earth's gravity, as described in 40 CFR 1065.630.

Δh = change in elevation over the measurement interval, in m. Assume $\Delta h = 0$ if you are not correcting for grade.

Δs = distance the vehicle travels down the road during the measurement interval, in m.

A_m = the calculated value of the y-intercept based on the curve-fit.

(E) Calculate drag area, C_dA , in m^2 using the following equation:

$$C_dA = \frac{2 \cdot D_{adj}}{\rho}$$

Eq. 1066.310-3

Where:

ρ = air density at reference conditions = 1.17 kg/ m^3 .

$$D_{adj} = D \cdot \left(\frac{\bar{T}}{293} \right) \cdot \left(\frac{98.21}{\bar{P}_{act}} \right)$$

Eq. 1066.310-4

\bar{T} = mean ambient absolute temperature during testing, in K.

\bar{P} = mean ambient pressuring during the test, in kPa.

* * * * *

Subpart E—Preparing Vehicles and Running an Exhaust Emission Test

■ 299. Section 1066.410 is amended by revising paragraphs (c) and (h) introductory text to read as follows:

§ 1066.410 Dynamometer test procedure.

* * * * *

(c) Record the vehicle's speed trace based on the time and speed data from the dynamometer at the recording frequencies given in Table 1 of § 1066.125. Record speed to at least the nearest 0.01 mi/hr and time to at least the nearest 0.1 s.

* * * * *

(h) Determine equivalent test weight as follows:

* * * * *

■ 300. Section 1066.415 is amended by revising paragraph (e)(6)(ii) to read as follows:

§ 1066.415 Vehicle operation.

* * * *

(e) * * *

(6) * * *

(ii) For vehicles with manual transmission, shift gears in a way that represents reasonable shift patterns for in-use operation, considering vehicle speed, engine speed, and any other relevant variables. Disengage the clutch when the speed drops below 15 mi/hr, when engine roughness is evident, or when good engineering judgment indicates the engine is likely to stall. Manufacturers may recommend shift guidance in the owners manual that differs from the shift schedule used during testing, as long as both shift schedules are described in the application for certification; in this case, we may shift during testing as described in the owners manual.

■ 301. Section 1066.425 is amended by revising paragraphs (b)(1), (2), and (3) to read as follows:

§ 1066.425 Performing emission tests.

* * * *

(b) * * *

(1) The upper limit is 2.0 mi/hr higher than the highest point on the trace within 1.0 s of the given point in time.

(2) The lower limit is 2.0 mi/hr lower than the lowest point on the trace within 1.0 s of the given time.

(3) The same limits apply for vehicle operation without exhaust measurements, such as vehicle preconditioning and warm-up, except that the upper and lower limits for speed values are ± 4.0 mi/hr. In addition, up to three occurrences of speed variations greater than the tolerance are

acceptable for vehicle operation in which no exhaust emission standards apply, as long as they occur for less than 15 seconds on any occasion and are clearly documented as to the time and speed at that point of the driving schedule.

* * * *

Subpart G—Calculations

■ 302. Section 1066.605 is amended by revising paragraphs (c) introductory text and (d) through (g) and adding paragraph (h) to read as follows:

§ 1066.605 Mass-based and molar-based exhaust emission calculations.

* * * *

(c) Perform the following sequence of preliminary calculations to correct recorded concentration measurements before calculating mass emissions in paragraphs (e) and (f) of this section:

* * * *

(d) Calculate g/mile emission rates using the following equation unless the standard-setting part specifies otherwise:

$$e_{[\text{emission}]} = \frac{m_{[\text{emission}]}}{D}$$

Eq. 1066.605-1

Where:

$e_{[\text{emission}]}$ = emission rate over the test interval.

$m_{[\text{emission}]}$ = emission mass over the test interval.

D = the measured driving distance over the test interval.

Example:
 $m_{\text{NOx}} = 0.3177 \text{ g}$

$$m_{\text{PM}} = \left(\frac{V_{\text{mix}}}{V_{\text{PMstd}} - V_{\text{sdstd}}} \right) \cdot (m_{\text{PMfil}} - m_{\text{PMbkgnd}})$$

Eq. 1066.605-3

Where:

m_{PM} = mass of particulate matter emissions over the test interval, as described in § 1066.815(b)(1), (2), and (3).

V_{mix} = total dilute exhaust volume over the test interval, corrected to standard reference conditions, and corrected for any volume removed for emission sampling and for any volume change from adding secondary dilution air. For partial-flow dilution systems, set V_{mix} equal to the total exhaust volume over

the test interval, corrected to standard reference conditions.

V_{PMstd} = total volume of dilute exhaust sampled through the filter over the test interval, corrected to standard reference conditions.

V_{sdstd} = total volume of secondary dilution air sampled through the filter over the test interval, corrected to standard reference conditions. For partial-flow dilution systems, set V_{sdstd} equal to total dilution air volume over the test interval, corrected to standard reference conditions.

$D_{\text{HFET}} = 10.19 \text{ miles}$

$$e_{\text{NOx}} = \frac{0.3177}{10.19} = 0.0312 \text{ g/mi}$$

(e) Calculate the emission mass of each gaseous pollutant using the following equation:

$$m_{[\text{emission}]} = V_{\text{mix}} \cdot \rho_{[\text{emission}]} \cdot x_{[\text{emission}]} \cdot c$$

Eq. 1066.605-2

Where:

$m_{[\text{emission}]}$ = emission mass over the test interval.

V_{mix} = total dilute exhaust volume over the test interval, corrected to standard reference conditions, and corrected for any volume removed for emission sampling and for any volume change from adding secondary dilution air.

$\rho_{[\text{emission}]}$ = density of the appropriate chemical species as given in § 1066.1005(f).

$x_{[\text{emission}]}$ = measured emission concentration in the sample, after dry-to-wet and background corrections.

$c = 10^{-2}$ for emission concentrations in %, and 10^{-6} for emission concentrations in ppm.

Example:

$V_{\text{mix}} = 170.878 \text{ m}^3$ (from paragraph (f) of this section)

$\rho_{\text{NOx}} = 1913 \text{ g/m}^3$

$x_{\text{NOx}} = 0.9721 \text{ ppm}$

$c = 10^{-6}$

$m_{\text{NOx}} = 170.878 \cdot 1913 \cdot 0.9721 \cdot 10^{-6} = 0.3177 \text{ g}$

(f) Calculation of the emission mass of PM, m_{PM} , is dependent on how many PM filters you use, as follows:

(1) Except as otherwise specified in this paragraph (f), calculate m_{PM} using the following equation:

m_{PMfil} = mass of particulate matter emissions on the filter over the test interval.

m_{PMbkgnd} = mass of particulate matter on the background filter.

Example:

$V_{\text{mix}} = 170.878 \text{ m}^3$ (from paragraph (g) of this section)

$V_{\text{PMstd}} = 0.925 \text{ m}^3$ (from paragraph (g) of this section)

$V_{\text{sdstd}} = 0.527 \text{ m}^3$ (from paragraph (g) of this section)

$m_{\text{PMfil}} = 0.0000045 \text{ g}$

$m_{\text{PMbkgnd}} = 0.0000014 \text{ g}$

$$m_{PM} = \left(\frac{170.878}{0.925 - 0.527} \right) \cdot (0.0000045 - 0.0000014) = 0.00133 \text{ g}$$

(2) If you sample PM onto a single filter as described in § 1066.815(b)(4)(i) or (b)(4)(ii) (for constant volume

samplers), calculate m_{PM} using the following equation:

$$m_{PM} = \left(\frac{V_{mix}}{\left(\frac{V_{ct-PMstd} - V_{ct-sdastd}}{0.43} \right) + (V_{s-PMstd} - V_{s-sdastd}) + \left(\frac{V_{ht-PMstd} - V_{ht-sdastd}}{0.57} \right)} \right) \cdot (m_{PMfil} - m_{PMbkngnd})$$

Eq. 1066.605-4

Where:

m_{PM} = mass of particulate matter emissions over the entire FTP.

V_{mix} = total dilute exhaust volume over the test interval, corrected to standard reference conditions, and corrected for any volume removed for emission sampling and for any volume change from adding secondary dilution air.

$V_{[interval]-PMstd}$ = total volume of dilute exhaust sampled through the filter over the test interval (ct = cold transient, s =

stabilized, ht = hot transient), corrected to standard reference conditions.

$V_{[interval]-sdastd}$ = total volume of secondary dilution air sampled through the filter over the test interval (ct = cold transient, s = stabilized, ht = hot transient), corrected to standard reference conditions.

m_{PMfil} = mass of particulate matter emissions on the filter over the test interval.

$m_{PMbkngnd}$ = mass of particulate matter on the background filter over the test interval.

Example:

$V_{mix} = 633.691 \text{ m}^3$

$V_{ct-PMstd} = 0.925 \text{ m}^3$

$V_{ct-sdastd} = 0.527 \text{ m}^3$

$V_{s-PMstd} = 1.967 \text{ m}^3$

$V_{s-sdastd} = 1.121 \text{ m}^3$

$V_{ht-PMstd} = 1.122 \text{ m}^3$

$V_{ht-sdastd} = 0.639 \text{ m}^3$

$m_{PMfil} = 0.0000106 \text{ g}$

$m_{PMbkngnd} = 0.0000014 \text{ g}$

$$m_{PM} = \left(\frac{633.691}{\left(\frac{0.925 - 0.527}{0.43} \right) + (1.967 - 1.121) + \left(\frac{1.122 - 0.639}{0.57} \right)} \right) \cdot (0.0000106 - 0.0000014)$$

$m_{PM} = 0.00222 \text{ g}$

(3) If you sample PM onto a single filter as described in § 1066.815(b)(4)(ii) (for partial flow dilution systems),

calculate m_{PM} using the following equation:

$$m_{PM} = \left(\frac{\frac{0.43 \cdot V_{ct-exhstd}}{V_{ct-PMstd} - V_{ct-dilstd}} + \frac{V_{s-exhstd}}{V_{s-PMstd} - V_{s-dilstd}} + \frac{0.57 \cdot V_{ht-exhstd}}{V_{ht-PMstd} - V_{ht-dilstd}}}{3} \right) \cdot (m_{PMfil} - m_{PMbkngnd})$$

Eq. 1066.605-5

Where:

m_{PM} = mass of particulate matter emissions over the entire FTP.

$V_{[interval]-exhstd}$ = total engine exhaust volume over the test interval (ct = cold transient, s = stabilized, ht = hot transient), corrected to standard reference conditions, and corrected for any volume removed for emission sampling.

$V_{[interval]-PMstd}$ = total volume of dilute exhaust sampled through the filter over the test interval (ct = cold transient, s =

stabilized, ht = hot transient), corrected to standard reference conditions.

$V_{[interval]-dilstd}$ = total volume of dilution air over the test interval (ct = cold transient, s = stabilized, ht = hot transient), corrected to standard reference conditions and for any volume removed for emission sampling.

m_{PMfil} = mass of particulate matter emissions on the filter over the test interval.

$m_{PMbkngnd}$ = mass of particulate matter on the background filter over the test interval.

Example:

$V_{ct-exhstd} = 5.55 \text{ m}^3$

$V_{ct-PMstd} = 0.526 \text{ m}^3$

$V_{ct-dilstd} = 0.481 \text{ m}^3$

$V_{s-exhstd} = 9.53 \text{ m}^3$

$V_{s-PMstd} = 0.903 \text{ m}^3$

$V_{s-dilstd} = 0.857 \text{ m}^3$

$V_{ht-exhstd} = 5.54 \text{ m}^3$

$V_{ht-PMstd} = 0.527 \text{ m}^3$

$V_{ht-dilstd} = 0.489 \text{ m}^3$

$m_{PMfil} = 0.0000106 \text{ g}$

$m_{PMbkngnd} = 0.0000014 \text{ g}$

$$m_{\text{PM}} = \left(\frac{\frac{0.43 \cdot 5.55}{0.526 - 0.481} + \frac{9.53}{0.903 - 0.857} + \frac{0.57 \cdot 5.54}{0.527 - 0.489}}{3} \right) \cdot (0.0000106 - 0.0000014)$$

$m_{\text{PM}} = 0.00269 \text{ g}$

(4) If you sample PM onto a single filter as described in § 1066.815(b)(5)(i) or (b)(5)(ii) (for constant volume

samplers), calculate m_{PM} using the following equation:

$$m_{\text{PM}} = \left(\frac{\frac{V_{\text{mix}}}{\left(\frac{V_{\text{ct-PMstd}} - V_{\text{ct-sdstd}}}{0.43} \right) + \left(\frac{V_{\text{cs-PMstd}} - V_{\text{cs-sdstd}}}{0.57} \right) + \left(\frac{V_{\text{ht-PMstd}} - V_{\text{ht-sdstd}}}{0.57} \right) + \left(\frac{V_{\text{hs-PMstd}} - V_{\text{hs-sdstd}}}{0.57} \right)}}{0.43 + 0.57 + 0.57 + 0.57} \right) \cdot (m_{\text{PMfil}} - m_{\text{PMbknd}})$$

Eq. 1066.605-6

Where:

m_{PM} = mass of particulate matter emissions over the entire FTP.

V_{mix} = total dilute exhaust volume over the test interval, corrected to standard reference conditions, and corrected for any volume removed for emission sampling and for any volume change from secondary dilution air.

$V_{[\text{interval}]\text{-PMstd}}$ = total volume of dilute exhaust sampled through the filter over the test interval (ct = cold transient, cs = cold

stabilized, ht = hot transient, hs = hot stabilized), corrected to standard reference conditions.

$V_{[\text{interval}]\text{-sdstd}}$ = total volume of secondary dilution air sampled through the filter over the test interval (ct = cold transient, cs = cold stabilized, ht = hot transient, hs = hot stabilized), corrected to standard reference conditions.

m_{PMfil} = mass of particulate matter emissions on the filter over the test interval.

m_{PMbknd} = mass of particulate matter on the background filter over the test interval.

Example:

$V_{\text{mix}} = 972.121 \text{ m}^3$

$V_{\text{ct-PMstd}} = 0.925 \text{ m}^3$

$V_{\text{ct-sdstd}} = 0.529 \text{ m}^3$

$V_{\text{cs-PMstd}} = 1.968 \text{ m}^3$

$V_{\text{cs-sdstd}} = 1.123 \text{ m}^3$

$V_{\text{ht-PMstd}} = 1.122 \text{ m}^3$

$V_{\text{ht-sdstd}} = 0.641 \text{ m}^3$

$V_{\text{hs-PMstd}} = 1.967 \text{ m}^3$

$V_{\text{hs-sdstd}} = 1.121 \text{ m}^3$

$m_{\text{PMfil}} = 0.0000229 \text{ g}$

$m_{\text{PMbknd}} = 0.0000014 \text{ g}$

$$m_{\text{PM}} = \left(\frac{\frac{972.121}{\left(\frac{0.925 - 0.529}{0.43} \right) + \left(\frac{1.968 - 1.123}{0.57} \right) + \left(\frac{1.122 - 0.641}{0.57} \right) + \left(\frac{1.967 - 1.121}{0.57} \right)}}{0.43 + 0.57 + 0.57 + 0.57} \right) \cdot (0.0000229 - 0.0000014)$$

$m_{\text{PM}} = 0.00401 \text{ g}$

(5) If you sample PM onto a single filter as described in § 1066.815(b)(5)(ii) (for partial flow dilution systems),

calculate m_{PM} using the following equation:

$$m_{\text{PM}} = \left(\frac{0.43 \cdot \left(\frac{V_{\text{ct-exhstd}} + V_{\text{cs-exhstd}}}{V_{\text{ct-PMstd}} - V_{\text{ct-dilstd}} + V_{\text{cs-PMstd}} - V_{\text{cs-dilstd}}} \right) + 0.57 \cdot \left(\frac{V_{\text{ht-exhstd}} + V_{\text{hs-exhstd}}}{V_{\text{ht-PMstd}} - V_{\text{ht-dilstd}} + V_{\text{hs-PMstd}} - V_{\text{hs-dilstd}}} \right)}{2} \right) \cdot (m_{\text{PMfil}} - m_{\text{PMbknd}})$$

Eq. 1066.605-7

Where:

m_{PM} = mass of particulate matter emissions over the entire FTP.

$V_{[\text{interval}]\text{-exhstd}}$ = total engine exhaust volume over the test interval (ct = cold transient,

cs = cold stabilized, ht = hot transient, hs = hot stabilized), corrected to standard reference conditions, and corrected for any volume removed for emission sampling.

$V_{[\text{interval}]\text{-PMstd}}$ = total volume of dilute exhaust sampled through the filter over the test interval (ct = cold transient, cs = cold stabilized, ht = hot transient, hs = hot stabilized), corrected to standard reference conditions.

$V_{[\text{interval}]\text{-dilstd}}$ = total volume of dilution air over the test interval (ct = cold transient, cs = cold stabilized, ht = hot transient, hs = hot stabilized), corrected to standard reference conditions and for any volume removed for emission sampling.

m_{PMfil} = mass of particulate matter emissions on the filter over the test interval.

m_{PMbkgnd} = mass of particulate matter on the background filter over the test interval.

Example:

$V_{\text{ct-exhstd}} = 5.55 \text{ m}^3$
 $V_{\text{ct-PMstd}} = 0.526 \text{ m}^3$
 $V_{\text{ct-dilstd}} = 0.481 \text{ m}^3$
 $V_{\text{cs-exhstd}} = 9.53 \text{ m}^3$
 $V_{\text{cs-PMstd}} = 0.903 \text{ m}^3$

$V_{\text{cs-dilstd}} = 0.857 \text{ m}^3$
 $V_{\text{ht-exhstd}} = 5.54 \text{ m}^3$
 $V_{\text{ht-PMstd}} = 0.527 \text{ m}^3$
 $V_{\text{ht-dilstd}} = 0.489 \text{ m}^3$
 $V_{\text{hs-exhstd}} = 9.54 \text{ m}^3$
 $V_{\text{hs-PMstd}} = 0.902 \text{ m}^3$
 $V_{\text{hs-dilstd}} = 0.856 \text{ m}^3$
 $m_{\text{PMfil}} = 0.0000229 \text{ g}$
 $m_{\text{PMbkgnd}} = 0.0000014 \text{ g}$

$$m_{\text{PM}} = \left(\frac{0.43 \cdot \left(\frac{5.55 + 9.53}{0.526 - 0.481 + 0.903 - 0.857} \right) + 0.57 \cdot \left(\frac{5.54 + 9.54}{0.527 - 0.489 + 0.902 - 0.856} \right)}{2} \right) \cdot (0.0000229 - 0.0000014)$$

$m_{\text{PM}} = 0.00266 \text{ g}$

(g) This paragraph (g) describes how to correct flow and flow rates to standard reference conditions and

provides an example for determining V_{mix} based on CVS total flow and the removal of sample flow from the dilute exhaust gas. You may use predetermined nominal values for

removed sample volumes, except for flows used for batch sampling.

(1) Correct flow and flow rates to standard reference conditions as needed using the following equation:

$$V_{[\text{flow}]\text{std}} = \frac{V_{[\text{flow}]\text{act}} \cdot p_{\text{in}} \cdot T_{\text{std}}}{p_{\text{std}} \cdot T_{\text{in}}}$$

Eq. 1066.605-8

Where:

$V_{[\text{flow}]\text{std}}$ = total flow volume at the flow meter, corrected to standard reference conditions.

$V_{[\text{flow}]\text{act}}$ = total flow volume at the flow meter at test conditions.

p_{in} = absolute static pressure at the flow meter inlet, measured directly or

calculated as the sum of atmospheric pressure plus a differential pressure referenced to atmospheric pressure.

T_{std} = standard temperature.

p_{std} = standard pressure.

T_{in} = temperature of the dilute exhaust sample at the flow meter inlet.

Example:

$V_{\text{PMact}} = 1.071 \text{ m}^3$

$p_{\text{in}} = 101.7 \text{ kPa}$

$T_{\text{std}} = 293.15 \text{ K}$

$p_{\text{std}} = 101.325 \text{ kPa}$

$T_{\text{in}} = 340.5 \text{ K}$

$$V_{\text{PMstd}} = \frac{1.071 \cdot 101.7 \cdot 293.15}{101.325 \cdot 340.5} = 0.925 \text{ m}^3$$

(2) The following example provides a determination of V_{mix} based on CVS total flow and the removal of sample flow from one dilute exhaust gas analyzer and one PM sampling system

that is utilizing secondary dilution. Note that your V_{mix} determination may vary from Eq. 1066.605-7 based on the number of flows that are removed from your dilute exhaust gas and whether

your PM sampling system is using secondary dilution. For this example, V_{mix} is governed by the following equation:

$$V_{\text{mix}} = V_{\text{CVSstd}} + V_{\text{gasstd}} + V_{\text{PMstd}} - V_{\text{sdastd}}$$

Eq. 1066.605-9

Where:

V_{CVSstd} = total dilute exhaust volume over the test interval at the flow meter, corrected to standard reference conditions.

V_{gasstd} = total volume of sample flow through the gaseous emission bench over the test interval, corrected to standard reference conditions.

V_{PMstd} = total volume of dilute exhaust sampled through the filter over the test

interval, corrected to standard reference conditions.

V_{sdastd} = total volume of secondary dilution air flow sampled through the filter over the test interval, corrected to standard reference conditions.

Example:

Using Eq. 1066.605-8:

$V_{\text{CVSstd}} = 170.451 \text{ m}^3$, where $V_{\text{CVSact}} = 170.721 \text{ m}^3$, $p_{\text{in}} = 101.7 \text{ kPa}$, and $T_{\text{in}} = 294.7 \text{ K}$

Using Eq. 1066.605-8:

$V_{\text{gasstd}} = 0.028 \text{ m}^3$, where $V_{\text{gasact}} = 0.033 \text{ m}^3$, $p_{\text{in}} = 101.7 \text{ kPa}$, and $T_{\text{in}} = 340.5 \text{ K}$

Using Eq. 1066.605-8:

$V_{\text{PMstd}} = 0.925 \text{ m}^3$, where $V_{\text{PMact}} = 1.071 \text{ m}^3$, $p_{\text{in}} = 101.7 \text{ kPa}$, and $T_{\text{in}} = 340.5 \text{ K}$

Using Eq. 1066.605-8:

$V_{\text{sda std}} = 0.527 \text{ m}^3$, where $V_{\text{sda act}} = 0.531 \text{ m}^3$,
 $p_{\text{in}} = 101.7 \text{ kPa}$, and $T_{\text{in}} = 296.3 \text{ K}$
 $V_{\text{mix}} = 170.451 + 0.028 + 0.925 - 0.527 =$
 170.878 m^3

(h) Calculate total flow volume over a test interval, $V_{[\text{flow}]}$, for a CVS or exhaust gas sampler as follows:

(1) *Varying versus constant flow rates.* The calculation methods depend on differentiating varying and constant flow, as follows:

(i) We consider the following to be examples of varying flows that require

a continuous multiplication of concentration times flow rate: raw exhaust, exhaust diluted with a constant flow rate of dilution air, and CVS dilution with a CVS flow meter that does not have an upstream heat exchanger or electronic flow control.

(ii) We consider the following to be examples of constant exhaust flows: CVS diluted exhaust with a CVS flow meter that has an upstream heat

exchanger, an electronic flow control, or both.

(2) *Continuous sampling.* For continuous sampling, you must frequently record a continuously updated flow signal. This recording requirement applies for both varying and constant flow rates.

(i) *Varying flow rate.* If you continuously sample from a varying exhaust flow rate, calculate $V_{[\text{flow}]}$ using the following equation:

$$V_{[\text{flow}]} = \sum_{i=1}^N \dot{Q}_i \cdot \Delta t$$

Eq. 1066.605-10

Where:

$$\Delta t = 1/f_{\text{record}}$$

Eq. 1066.605-11

Example:

$N = 505$

$\dot{Q}_{\text{CVS1}} = 0.276 \text{ m}^3/\text{s}$

$\dot{Q}_{\text{CVS2}} = 0.294 \text{ m}^3/\text{s}$

$f_{\text{record}} = 1 \text{ Hz}$

Using Eq. 1066.605-11,

$\Delta t = 1/1 = 1 \text{ s}$

$V_{\text{CVS}} = (0.276 + 0.294 + \dots + \dot{Q}_{\text{CVS505}}) \cdot 1$

$V_{\text{CVS}} = 170.721 \text{ m}^3$

(ii) *Constant flow rate.* If you continuously sample from a constant exhaust flow rate, use the same calculation described in paragraph

(h)(2)(i) of this section or calculate the mean flow recorded over the test interval and treat the mean as a batch sample, as described in paragraph (h)(3)(ii) of this section.

(3) *Batch sampling.* For batch sampling, calculate total flow by integrating a varying flow rate or by determining the mean of a constant flow rate, as follows:

(i) *Varying flow rate.* If you proportionally collect a batch sample from a varying exhaust flow rate,

integrate the flow rate over the test interval to determine the total flow from which you extracted the proportional sample, as described in paragraph (h)(2)(i) of this section.

(ii) *Constant flow rate.* If you batch sample from a constant exhaust flow rate, extract a sample at a proportional or constant flow rate and calculate $V_{[\text{flow}]}$ from the flow from which you extract the sample by multiplying the mean flow rate by the time of the test interval using the following equation:

$$V_{[\text{flow}]} = \bar{Q} \cdot \Delta t$$

Eq. 1066.605-12

Example:

$\bar{Q}_{\text{CVS}} = 0.338 \text{ m}^3/\text{s}$

$\Delta t = 505 \text{ s}$

$V_{\text{CVS}} = 0.338 \cdot 505$

$V_{\text{CVS}} = 170.69 \text{ m}^3$

■ 303. Section 1066.615 is amended by revising paragraph (a)(1) to read as follows:

§ 1066.615 NO_x intake-air humidity correction.

* * * *

(a) * * *

(1) Calculate a humidity correction using a time-weighted mean value for ambient humidity over the test interval. Calculate absolute ambient humidity, H , using the following equation:

$$H = \frac{1000 \cdot M_{\text{H}_2\text{O}} \cdot p_d \cdot RH}{M_{\text{air}} \cdot (p_{\text{atmos}} - p_d \cdot RH)}$$

Eq. 1066.615-1

Where:

$M_{\text{H}_2\text{O}}$ = molar mass of H_2O .

p_d = saturated vapor pressure at the ambient dry bulb temperature.

RH = relative humidity of ambient air

M_{air} = molar mass of air.

p_{atmos} = atmospheric pressure.

Example:

$M_{\text{H}_2\text{O}}$ = 18.01528 g/mol

p_d = 2.93 kPa

RH = 37.5% = 0.375

M_{air} = 28.96559 g/mol

p_{atmos} = 96.71 kPa

$$H = \frac{1000 \cdot 18.01528 \cdot 2.93 \cdot 0.375}{28.96559 \cdot (96.71 - 2.93 \cdot 0.375)} = 7.14741 \text{ g H}_2\text{O vapor/kg dry air}$$

* * * * *

■ 304. Section 1066.625 is amended by revising the introductory text and paragraphs (a)(1), (b) introductory text, (b)(1), (b)(2)(i), (b)(2)(iv)(A) and (D), (b)(2)(v), (vi), and (vii), (b)(2)(xiii), and (c)(1)(i), (ii), and (iii) to read as follows:

§ 1066.625 Flow meter calibration calculations.

This section describes the calculations for calibrating various flow meters based on mass flow rates. Calibrate your flow meter according to 40 CFR 1065.640 instead if you

calculate emissions based on molar flow rates.

(a) * * *

(1) Calculate PDP volume pumped per revolution, V_{rev} , for each restrictor position from the mean values determined in § 1066.140:

$$V_{\text{rev}} = \frac{\bar{V}_{\text{ref}} \cdot \bar{T}_{\text{in}} \cdot p_{\text{std}}}{\bar{f}_{\text{nPDP}} \cdot \bar{P}_{\text{in}} \cdot T_{\text{std}}}$$

Eq. 1066.625-1

Where:

\bar{V}_{ref} = mean flow rate of the reference flow meter.

\bar{T}_{in} = mean temperature at the PDP inlet.

p_{std} = standard pressure = 101.325 kPa.

\bar{f}_{nPDP} = mean PDP speed.

\bar{P}_{in} = mean static absolute pressure at the PDP inlet.

T_{std} = standard temperature = 293.15 K.

Example:

\bar{V}_{ref} = 0.1651 m³/s

\bar{T}_{in} = 299.5 K

p_{std} = 101.325 kPa

\bar{f}_{nPDP} = 1205.1 r/min = 20.085 r/s

\bar{P}_{in} = 98.290 kPa

T_{std} = 293.15 K

$$V_{\text{rev}} = \frac{0.1651 \cdot 299.5 \cdot 101.3}{20.085 \cdot 98.290 \cdot 293.15}$$

$V_{\text{rev}} = 0.00866 \text{ m}^3/\text{r}$

* * * * *

(b) *SSV calibration*. The equations governing SSV flow assume one-dimensional isentropic inviscid flow of an ideal gas. Paragraph (b)(2)(iv) of this section describes other assumptions that may apply. If good engineering judgment dictates that you account for gas compressibility, you may either use an appropriate equation of state to

determine values of Z as a function of measured pressure and temperature, or you may develop your own calibration equations based on good engineering judgment. Note that the equation for the flow coefficient, C_f , is based on the ideal gas assumption that the isentropic exponent, γ , is equal to the ratio of specific heats, C_p/C_v . If good engineering judgment dictates using a real gas isentropic exponent, you may either use

an appropriate equation of state to determine values of γ as a function of measured pressure and temperature, or you may develop your own calibration equations based on good engineering judgment.

(1) Calculate volume flow rate at standard reference conditions, \bar{V}_{std} , as follows

$$\dot{V}_{\text{std}} = C_d \cdot C_f \cdot \frac{A_t \cdot R \cdot p_{\text{in}} \cdot T_{\text{std}}}{p_{\text{std}} \cdot \sqrt{Z \cdot M_{\text{mix}} \cdot R \cdot T_{\text{in}}}}$$

Eq. 1066.625-3

Where:

C_d = discharge coefficient, as determined in paragraph (b)(2)(i) of this section.

C_f = flow coefficient, as determined in paragraph (b)(2)(ii) of this section.

A_t = cross-sectional area at the venturi throat.

R = molar gas constant.

p_{in} = static absolute pressure at the venturi inlet.

T_{std} = standard temperature.

p_{std} = standard pressure.

Z = compressibility factor.

M_{mix} = molar mass of gas mixture.

T_{in} = absolute temperature at the venturi inlet.

(2) * * *

(i) Using the data collected in § 1066.140, calculate C_d for each flow rate using the following equation:

$$C_d = \dot{V}_{\text{ref}} \cdot \frac{p_{\text{std}} \cdot \sqrt{Z \cdot M_{\text{mix}} \cdot R \cdot T_{\text{in}}}}{C_f \cdot A_t \cdot R \cdot p_{\text{in}} \cdot T_{\text{std}}}$$

Eq. 1066.625-4

Where:

 \dot{V}_{ref} = measured volume flow rate from the reference flow meter.

* * * *

(iv) * * *

(A) For raw exhaust, diluted exhaust, and dilution air, you may assume that the gas mixture behaves as an ideal gas ($Z = 1$).

* * * *

(D) For diluted exhaust and dilution air, you may assume the molar mass of the mixture, M_{mix} , is a function only of the amount of water in the dilution air or calibration air, as follows:

$$M_{\text{mix}} = M_{\text{air}} \cdot (1 - x_{\text{H}_2\text{O}}) + M_{\text{H}_2\text{O}} \cdot x_{\text{H}_2\text{O}}$$

Eq. 1066.625-7

Where:

 M_{air} = molar mass of dry air. $x_{\text{H}_2\text{O}}$ = amount of H_2O in the dilution air or calibration air, determined as described in 40 CFR 1065.645. $M_{\text{H}_2\text{O}}$ = molar mass of water.

Example:

 $M_{\text{air}} = 28.96559 \text{ g/mol}$ $x_{\text{H}_2\text{O}} = 0.0169 \text{ mol/mol}$ $M_{\text{H}_2\text{O}} = 18.01528 \text{ g/mol}$

$$M_{\text{mix}} = 28.96559 \cdot (1 - 0.0169) + 18.01528 \cdot 0.0169$$

$$M_{\text{mix}} = 28.7805 \text{ g/mol}$$

* * * *

(v) The following example illustrates the use of the governing equations to calculate C_d of an SSV flow meter at one reference flow meter value:

$$\dot{V}_{\text{ref}} = 2.395 \text{ m}^3/\text{s}$$

$$Z = 1$$

$$M_{\text{mix}} = 28.7805 \text{ g/mol} = 0.0287805 \text{ kg/mol}$$

$$R = 8.314472 \text{ J/(mol}\cdot\text{K)} = 8.314472 \text{ (m}^2\cdot\text{kg)/(s}^2\cdot\text{mol}\cdot\text{K)}$$

$$T_{\text{in}} = 298.15 \text{ K}$$

$$A_t = 0.01824 \text{ m}^2$$

$$p_{\text{in}} = 99.132 \text{ kPa} = 99132 \text{ Pa} = 99132 \text{ kg/(m}\cdot\text{s}^2)$$

$$\gamma = 1.399$$

$$\beta = 0.8$$

$$\Delta p = 7.653 \text{ kPa}$$

$$r = 1 - \frac{2.312}{99.132} = 0.922$$

$$C_f = \left[\frac{2 \cdot 1.399 \cdot \left(0.922^{\frac{1.399-1}{1.399}} - 1 \right)}{(1.399-1) \cdot \left(0.8^4 - 0.922^{\frac{-2}{1.399}} \right)} \right]^{\frac{1}{2}}$$

$$C_f = 0.472$$

$$C_d = 2.395 \cdot \frac{101325 \cdot \sqrt{1 \cdot 0.0287805 \cdot 8.314472 \cdot 298.15}}{0.472 \cdot 0.01824 \cdot 8.314472 \cdot 99132 \cdot 293.15}$$

$$C_d = 0.985$$

(vi) Calculate the Reynolds number, $Re^\#$, for each reference flow rate at standard conditions, \dot{V}_{refstd} , using the throat diameter of the venturi, d_t , andthe air density at standard conditions, ρ_{std} . Because the dynamic viscosity, μ , is needed to compute $Re^\#$, you may use your own fluid viscosity model to determine μ for your calibration gas (usually air), using good engineeringjudgment. Alternatively, you may use the Sutherland three-coefficient viscosity model to approximate μ , as shown in the following sample calculation for $Re^\#$:

$$Re^\# = \frac{4 \cdot \rho_{\text{std}} \cdot \dot{V}_{\text{refstd}}}{\pi \cdot d_t \cdot \mu}$$

Eq. 1066.625-8

Where, using the Sutherland three-coefficient viscosity model:

$$\mu = \mu_0 \cdot \left(\frac{T_{\text{in}}}{T_0} \right)^{\frac{3}{2}} \cdot \left(\frac{T_0 + S}{T_{\text{in}} + S} \right)$$

Eq. 1066.625-9

Where: T_0 = Sutherland reference temperature.
 μ_0 = Sutherland reference viscosity. S = Sutherland constant.

TABLE 3 OF § 1066.625—SUTHERLAND THREE-COEFFICIENT VISCOSITY MODEL PARAMETERS

Gas ¹	μ^0	T^0	S	Temperature range within $\pm 2\%$ error ²	Pressure limit ²
	kg/(m·s)	K	K	K	kPa
Air	$1.716 \cdot 10^{-5}$	273	111	170 to 1900	≤1800.
CO ₂	$1.370 \cdot 10^{-5}$	273	222	190 to 1700	≤3600.
H ₂ O	$1.12 \cdot 10^{-5}$	350	1064	360 to 1500	≤10000.
O ₂	$1.919 \cdot 10^{-5}$	273	139	190 to 2000	≤2500.
N ₂	$1.663 \cdot 10^{-5}$	273	107	100 to 1500	≤1600.

¹ Use tabulated parameters only for the pure gases, as listed. Do not combine parameters in calculations to calculate viscosities of gas mixtures.

² The model results are valid only for ambient conditions in the specified ranges.

Example: $S = 111 \text{ K}$
 $\mu_0 = 1.716 \cdot 10^{-5} \text{ kg/(m·s)}$
 $T_0 = 273 \text{ K}$

$$\mu = 1.716 \cdot 10^{-5} \cdot \left(\frac{298.15}{273} \right)^{\frac{3}{2}} \cdot \left(\frac{273 + 111}{298.15 + 111} \right) \mu = 1.838 \cdot 10^{-5} \text{ kg/(m·s)}$$

$T_{\text{in}} = 298.15 \text{ K}$
 $d_t = 152.4 \text{ mm} = 0.1524 \text{ m}$
 $\rho_{\text{std}} = 1.1509 \text{ kg/m}^3$

$$Re^{\#} = \frac{4 \cdot 1.1964 \cdot 2.395}{3.14159 \cdot 0.1524 \cdot 1.838 \cdot 10^{-5}}$$

$Re^{\#} = 1.3027 \cdot 10^6$

(vii) Calculate ρ using the following equation:

$$\rho_{\text{std}} = \frac{p_{\text{std}} \cdot MW_{\text{mix}}}{R \cdot T_{\text{std}}}$$

Eq. 1066.625-10

Example:

$$\rho_{\text{std}} = \frac{101325 \cdot 0.0287805}{8.314472 \cdot 293.15}$$

$$\rho_{\text{std}} = 1.1964 \text{ kg/m}^3$$

* * * * *

(xiii) Once you have an equation that meets the specified statistical criterion,

you may use the equation only for the corresponding range of $Re^\#$.

* * * * *

(c) * * *

(1) * * *

(i) Calculate an individual K_v for each calibration set point for each restrictor position using the following equation:

$$K_v = \frac{\bar{V}_{\text{refstd}} \cdot \sqrt{\bar{T}_{\text{in}}}}{\bar{P}_{\text{in}}}$$

Eq. 1066.625-12

Where:

\bar{V}_{refstd} = mean flow rate from the reference flow meter, corrected to standard reference conditions.

\bar{T}_{in} = mean temperature at the venturi inlet.

\bar{P}_{in} = mean static absolute pressure at the venturi inlet.

(ii) Calculate the mean and standard deviation of all the K_v values (see 40 CFR

1065.602). Verify choked flow by plotting K_v as a function of p_{in} . K_v will have a relatively constant value for choked flow; as vacuum pressure increases, the venturi will become unchoked and K_v will decrease. Paragraphs (c)(1)(iii) through (viii) of this section describe how to verify your range of choked flow.

(iii) If the standard deviation of all the K_v values is less than or equal to 0.3% of the mean K_v , use the mean K_v in Eq. 1066.630–7, and use the CFV only up to the highest venturi pressure ratio, r , measured during calibration using the following equation:

$$r = 1 - \frac{\Delta p_{\text{CFV}}}{p_{\text{in}}}$$

Eq. 1066.625-13

Where:

Δp_{CFV} = differential static pressure; venturi inlet minus venturi outlet.

p_{in} = mean static absolute pressure at the venturi inlet.

* * * * *

■ 305. Section 1066.630 is revised to read as follows:

§ 1066.630 PDP, SSV, and CFV flow rate calculations.

This section describes the equations for calculating flow rates from various flow meters. After you calibrate a flow meter according to § 1066.625, use the calculations described in this section to calculate flow during an emission test. Calculate flow according to 40 CFR

1065.642 instead if you calculate emissions based on molar flow rates.

(a) *PDP*. (1) Based on the speed at which you operate the PDP for a test interval, select the corresponding slope, a_1 , and intercept, a_0 , as determined in § 1066.625(a), to calculate PDP flow rate, \dot{V} , as follows:

$$\dot{V} = f_{\text{nPDP}} \cdot \frac{V_{\text{rev}} \cdot T_{\text{std}} \cdot p_{\text{in}}}{T_{\text{in}} \cdot p_{\text{std}}}$$

Eq. 1066.630-1

Where:

f_{nPDP} = pump speed.

V_{rev} = PDP volume pumped per revolution, as determined in paragraph (a)(2) of this section.

T_{std} = standard temperature = 293.15 K.

p_{in} = static absolute pressure at the PDP inlet.

T_{in} = absolute temperature at the PDP inlet.

p_{std} = standard pressure = 101.325 kPa.

(2) Calculate V_{rev} using the following equation:

$$V_{\text{rev}} = \frac{a_1}{f_{\text{nPDP}}} \cdot \sqrt{\frac{p_{\text{out}} - p_{\text{in}}}{p_{\text{out}}}} + a_0$$

Eq. 1066.630-2

p_{out} = static absolute pressure at the PDP outlet.

Example:

$a_1 = 0.8405 \text{ m}^3/\text{s}$

$f_{\text{nPDP}} = 12.58 \text{ r/s}$

$p_{\text{out}} = 99.950 \text{ kPa}$

$p_{\text{in}} = 98.575 \text{ kPa}$

$a_0 = 0.056 \text{ m}^3/\text{r}$

$T_{\text{in}} = 323.5 \text{ K}$

$$V_{\text{rev}} = \frac{0.8405}{12.58} \cdot \sqrt{\frac{99,950 - 98.575}{99,950}} + 0.056$$

$$V_{\text{rev}} = 0.063 \text{ m}^3/\text{r}$$

$$\dot{V} = 12.58 \cdot \frac{0.06383 \cdot 293.15 \cdot 98.575}{323.5 \cdot 101.3}$$

$$\dot{V} = 0.7079 \text{ m}^3/\text{s}$$

(b) SSV. Calculate SSV flow rate, \dot{V} , as follows:

$$\dot{V} = C_d \cdot C_f \cdot \frac{A_t \cdot R \cdot p_{\text{in}} \cdot T_{\text{std}}}{p_{\text{std}} \cdot \sqrt{Z \cdot M_{\text{mix}} \cdot R \cdot T_{\text{in}}}}$$

Eq. 1066.630-3

Where:

C_d = discharge coefficient, as determined based on the C_d versus $Re^{\#}$ equation in § 1066.625(b)(2)(viii).

C_f = flow coefficient, as determined in § 1066.625(b)(2)(ii).

A_t = venturi throat cross-sectional area.

R = molar gas constant.

p_{in} = static absolute pressure at the venturi inlet.

T_{std} = standard temperature.

p_{std} = standard pressure.

Z = compressibility factor.

M_{mix} = molar mass of gas mixture.

T_{in} = absolute temperature at the venturi inlet.

Example:

$C_d = 0.890$

$C_f = 0.472$

$A_t = 0.01824 \text{ m}^2$

$R = 8.314472 \text{ J}/(\text{mol} \cdot \text{K}) = 8.314472 (\text{m}^2 \cdot \text{kg})/(\text{s}^2 \cdot \text{mol} \cdot \text{K})$

$p_{\text{in}} = 98.496 \text{ kPa}$

$T_{\text{std}} = 293.15 \text{ K}$

$p_{\text{std}} = 101.325 \text{ kPa}$

$Z = 1$

$M_{\text{mix}} = 28.7789 \text{ g/mol} = 0.0287789 \text{ kg/mol}$

$T_{\text{in}} = 296.85 \text{ K}$

$$\dot{V} = 0.89 \cdot 0.472 \cdot \frac{0.01824 \cdot 8.314472 \cdot 98.496 \cdot 293.15}{101.325 \cdot \sqrt{1 \cdot 0.0287805 \cdot 8.314472 \cdot 296.85}}$$

$$\dot{V} = 2.155 \text{ m}^3/\text{s}$$

(c) CFV. If you use multiple venturis and you calibrated each venturi independently to determine a separate calibration coefficient, K_v , for each venturi, calculate the individual volume

flow rates through each venturi and sum all their flow rates to determine CFV flow rate, \dot{V} . If you use multiple venturis and you calibrated venturis in combination, calculate \dot{V} using the K_v

that was determined for that combination of venturis.

(1) To calculate \dot{V} through one venturi or a combination of venturis, use the mean K_v you determined in § 1066.625(c) and calculate \dot{V} as follows:

$$\dot{V} = \frac{K_v \cdot p_{\text{in}}}{\sqrt{T_{\text{in}}}}$$

Eq. 1066.630-4

Where:

K_v = flow meter calibration coefficient.

T_{in} = temperature at the venturi inlet.

p_{in} = absolute static pressure at the venturi inlet.

Example:

$K_v = 0.074954 \text{ m}^3 \cdot \text{K}^{0.5}/(\text{kPa} \cdot \text{s})$

$p_{\text{in}} = 99.654 \text{ kPa}$

$T_{\text{in}} = 353.15 \text{ K}$

$$\dot{V} = \frac{0.074954 \cdot 99.654}{\sqrt{353.15}}$$

$$\dot{V} = 0.39748 \text{ m}^3/\text{s}$$

(2) [Reserved]

■ 306. Section 1066.635 is amended by revising paragraphs (a) and (c) introductory text to read as follows:

§ 1066.635 NMOG determination.

* * * * *

(a) Determine NMOG by independently measuring alcohols and carbonyls as described in 40 CFR 1065.805 and 1065.845. Use good engineering judgment to determine

which alcohols and carbonyls you need to measure. This would typically require you to measure all alcohols and carbonyls that you expect to contribute 1% or more of total NMOG. Calculate

the mass of NMOG in the exhaust, m_{NMOG} , with the following equation, using density values specified in § 1066.1005(f):

$$m_{\text{NMOG}} = m_{\text{NMHC}} - \rho_{\text{NMHC}} \cdot \sum_{i=1}^N \frac{m_{\text{OHC}_i}}{\rho_{\text{OHC}_i}} \cdot RF_{\text{OHC}_i[\text{THC-FID}]} + \sum_{i=1}^N m_{\text{OHC}_i}$$

Eq. 1066.635-1

Where:

m_{NMHC} = the mass of NMHC and all oxygenated hydrocarbon (OHC) in the exhaust, as determined using Eq. 1066.605-2. Calculate NMHC mass based on ρ_{NMHC} .

ρ_{NMHC} = the effective C_1 -equivalent density of NMHC as specified in § 1066.1005(f).

m_{OHC_i} = the mass of oxygenated species i in the exhaust calculated using Eq. 1066.605-2.

ρ_{OHC_i} = the C_1 -equivalent density of oxygenated species i .

$RF_{\text{OHC}_i[\text{THC-FID}]}$ = the response factor of a THC-FID to oxygenated species i relative to propane on a C_1 -equivalent basis as determined in 40 CFR 1065.845.

* * *

(c) For gasoline containing less than 25% ethanol by volume, you may calculate NMOG from measured NMHC emissions as follows:

* * *

■ 307. Section 1066.695 is amended by revising paragraph (f) to read as follows:

§ 1066.695 Data requirements.

* * *

(f) Vehicle information as applicable, including identification number, model year, applicable emission standards (including bin standards or family emission limits, as applicable), vehicle model, vehicle class, test group, durability group, engine family, evaporative/refueling emission family, basic engine description (including displacement, number of cylinders, turbocharger/supercharger used, and catalyst type), fuel system (type of fuel injection and fuel tank capacity and location), engine code, GVWR, applicable test weight, inertia weight class, actual curb weight at zero miles, actual road load at 50 mi/hr, transmission class and configuration, axle ratio, odometer reading, idle rpm, and measured drive wheel tire pressure.

* * *

Subpart H—Cold Temperature Test Procedures

■ 308. Section 1066.710 is amended by revising paragraphs (a)(5) and (d)(3) introductory text to read as follows:

§ 1066.710 Cold temperature testing procedures for measuring CO and NMHC emissions and determining fuel economy.

* * *

(a) * * *

(5) Adjust the dynamometer to simulate vehicle operation on the road at -7°C as described in § 1066.305(b).

* * *

(d) * * *

(3) You may start the preconditioning drive once the fuel in the fuel tank reaches $(-12.6 \text{ to } -1.4)^\circ\text{C}$.

Precondition the vehicle as follows:

* * *

Subpart I—Exhaust Emission Test Procedures for Motor Vehicles

■ 309. Section 1066.801 is amended by revising paragraphs (c)(2) and (3) to read as follows:

§ 1066.801 Applicability and general provisions.

* * *

(c) * * *

(2) The Supplemental Federal Test Procedure (SFTP) measures the emission effects from aggressive driving and operation with the vehicle's air conditioner. The SFTP is based on a composite of three different test elements. In addition to the FTP, vehicles generally operate over the US06 and SC03 driving schedules as specified in paragraphs (g) and (h) of Appendix I of 40 CFR part 86, respectively. In the case of heavy-duty vehicles above 10,000 pounds GVWR and at or below 14,000 pounds GVWR, SFTP testing involves additional driving over the Hot LA-92 driving schedule as specified in paragraph (c) of 40 CFR part 86, Appendix I, instead of the US06 driving schedule. Note that the US06 driving schedule represents about 8.0 miles of relatively aggressive driving; the SC03 driving schedule represents about 3.6 miles of urban driving with the air conditioner operating; and the hot portion of the LA-92 driving schedule represents about 9.8 miles of relatively aggressive driving for commercial trucks. See § 1066.830.

(3) The Highway Fuel Economy Test (HFET) is specified in Appendix I of 40 CFR part 600. Note that the HFET represents about 10.2 miles of rural and freeway driving with an average speed of 48.6 mi/hr and a maximum speed of 60.0 mi/hr. See § 1066.840.

* * *

■ 310. Section 1066.805 is amended by revising paragraph (c) to read as follows:

§ 1066.805 Road-load power, test weight, and inertia weight class determination.

* * *

(c) For FTP, SFTP, New York City Cycle, HFET, and LA-92 testing, determine road-load forces for each test vehicle at speeds between 9.3 and 71.5 miles per hour. The road-load force must represent vehicle operation on a smooth, level road with no wind or calm winds, no precipitation, an ambient temperature of approximately 20°C , and atmospheric pressure of 98.21 kPa. You may extrapolate road-load force for speeds below 9.3 mi/hr.

■ 311. Section 1066.815 is amended by revising paragraphs (b) introductory text and (b)(4) and (5) to read as follows:

§ 1066.815 Exhaust emission test procedures for FTP testing.

* * *

(b) *PM sampling options.* Collect PM using any of the procedures specified in paragraphs (b)(1) through (5) of this section and use the corresponding equation in § 1066.820 to calculate FTP composite emissions. Testing must meet the requirements related to filter face velocity as described in § 1066.110(b)(2)(iii)(C), except as specified in paragraphs (b)(4) and (5) of this section. For procedures involving flow weighting, set the filter face velocity to a weighting target of 1.0 to meet the requirements of § 1066.110(b)(2)(iii)(C). Allow filter face velocity to decrease as a percentage of the weighting factor if the weighting factor is less than 1.0 and do not change the nominal CVS flowrates or secondary dilution ratios between FTP or UDDS test intervals. Use the appropriate

equations in § 1066.610 to show that you meet the dilution factor requirements of § 1066.110(b)(2)(iii)(B). If you collect PM using the procedures specified in paragraph (b)(4) or (5) of this section, the residence time requirements in 40 CFR 1065.140(e)(3) apply, except that you may exceed an overall residence time of 5.5 s for sample flow rates below the highest expected sample flow rate.

* * * * *

(4) You may collect PM on a single filter over the cold-start UDDS and the first 505 seconds of the hot-start UDDS using one of the following methods:

(i) Adjust your sampling system flow rate over the filter to weight the filter face velocity over the three intervals of the FTP based on weighting targets of 0.43 for bag 1, 1.0 for bag 2, and 0.57 for bag 3.

(ii) Maintain a constant sampling system flow rate over the filter for all

three intervals of the FTP by increasing overall dilution ratios for bag 1 and bag 3. To do this, reduce the sample flow rate from the exhaust (or diluted exhaust) such that the value is reduced to 43% and 57%, respectively, of the bag 2 values. For constant-volume samplers, this requires that you decrease the dilute exhaust sampling rate from the CVS and compensate for that by increasing the amount of secondary dilution air.

(5) You may collect PM on a single filter over the cold-start UDDS and the full hot-start UDDS using one of the following methods:

(i) Adjust your sampling system flow rate over the filter to weight the filter face velocity based on weighting targets of 0.75 for the cold-start UDDS and 1.0 for the hot-start UDDS.

(ii) Maintain a constant sampling system flow rate over the filter for both the cold-start and hot-start UDDS by increasing the overall dilution ratio for

the cold-start UDDS. To do this, reduce the sample flow rate from the exhaust (or diluted exhaust) such that the value is reduced to 75% of the hot-start UDDS value. For constant-volume samplers, this requires that you decrease the dilute exhaust sampling rate from the CVS and compensate for that by increasing the amount of secondary dilution air.

* * * * *

■ 312. Section 1066.820 is amended by revising paragraph (c) to read as follows:

§ 1066.820 Composite calculations for FTP exhaust emissions.

* * * * *

(c) Calculate the final composite PM test results as a mass-weighted value, $e_{PM-FTPcomp}$, in grams per mile as follows:

(1) Use the following equation for PM measured as described in § 1066.815(b)(1), (2), or (3):

$$e_{PM-FTPcomp} = 0.43 \cdot \left(\frac{m_{PM-cUDDS}}{D_{ct} + D_{cs}} \right) + 0.57 \cdot \left(\frac{m_{PM-hUDDS}}{D_{ht} + D_{hs}} \right)$$

Eq. 1066.820-2

Where:

$m_{PM-cUDDS}$ = the combined PM mass emissions determined from the cold-start UDDS test interval (bag 1 and bag 2), in grams, as calculated using Eq. 1066.605–3.

$m_{PM-hUDDS}$ = the combined PM mass emissions determined from the hot-start UDDS test interval (bag 3 and bag 4), in grams, as calculated using Eq. 1066.605–3. This is the hot-stabilized portion from either the first or second UDDS (bag 2,

unless you measure bag 4), in addition to the hot transient portion (bag 3).

(2) Use the following equation for PM measured as described in § 1066.815(b)(4):

$$e_{PM-FTPcomp} = \frac{m_{PM}}{(0.43 \cdot D_{ct}) + D_{cs} + (0.57 \cdot D_{ht})}$$

Eq. 1066.820-3

Where:

m_{PM} = the combined PM mass emissions determined from the cold-start UDDS

test interval and the first 505 seconds of the hot-start UDDS test interval (bag 1, bag 2, and bag 3), in grams, as calculated using Eqs. 1066.605–4 and 1066.605–5.

(3) Use the following equation for PM measured as described in § 1066.815(b)(5):

$$e_{PM-FTPcomp} = \frac{m_{PM}}{0.43 \cdot (D_{ct} + D_{cs}) + 0.57 \cdot (D_{ht} + D_{hs})}$$

Eq. 1066.820-4

Where:

m_{PM} = the combined PM mass emissions determined from the cold-start UDDS test interval and the hot-start UDDS test interval (bag 1, bag 2, bag 3, and bag 4),

in grams, as calculated using Eqs. 1066.605–6 and 1066.605–7.

§ 1066.835 Exhaust emission test procedure for SC03 emissions.

* * * * *

■ 313. Section 1066.835 is amended by revising paragraph (f)(3)(iv) to read as follows:

(f) * * *

(3) * * *

(iv) Check the uniformity of radiant energy intensity at least every 500 hours of emitter usage or every 6 months, whichever is sooner, and after any major modifications affecting the solar simulation. Determine uniformity by measuring radiant energy intensity using instruments that meet the specifications described in paragraph (f)(3)(iii) of this section at each point of a 0.5 m grid over the vehicle's full

footprint, including the edges of the footprint, at an elevation 1 m above the floor. Measured values of radiant energy intensity must be between (722 and 978) W/m² at all points.

Subpart J—Evaporative Emission Test Procedures

■ 314. Section 1066.985 is amended by revising paragraph (d)(8) to read as follows:

§ 1066.985 Fuel storage system leak test procedure.

* * * * *

(d) * * *

(8) Use the following equation, or a different equation you develop based on good engineering judgment, to calculate the effective leak diameter, d_{eff} :

$$d_{\text{eff}} = 7.844 \cdot \left(\frac{\dot{Q}_{\text{N}_2}}{\sqrt{(p_{\text{in}} - p_{\text{atmos}}) \cdot (p_{\text{in}} + p_{\text{atmos}})} \cdot SG_{\text{N}_2} \cdot T} \right)^{0.5057}$$

Eq. 1066.985-1

Where:

d_{eff} = effective leak diameter, in inches, expressed to at least two decimal places.

\dot{Q}_{N_2} = volumetric flow of nitrogen, in m³/s.

p_{in} = inlet pressure to orifice, in kPa.

p_{atmos} = atmospheric pressure, in kPa.

SG_{N_2} = specific gravity of N₂ relative to air at 101.325 kPa and 15.5 °C = 0.967.

T = temperature of flowing medium, in K.

Example:

\dot{Q}_{N_2} = 0.8 · 10⁻⁵ m³/s

p_{in} = 104.294 kPa

p_{atmos} = 101.332 kPa

SG_{N_2} = 0.967

T = 298.15 K

$$d_{\text{eff}} = 7.844 \cdot \left(\frac{0.8 \cdot 10^{-5}}{\sqrt{(104.294 - 101.332) \cdot (104.294 + 101.332)} \cdot 0.967 \cdot 298.15} \right)^{0.5057}$$

d_{eff} = 0.017 inches

* * * * *

Subpart K—Definitions and Other Reference Material

■ 315. Section 1066.1005 is amended by revising paragraph (a) to read as follows:

§ 1066.1005 Symbols, abbreviations, acronyms, and units of measure.

* * * * *

(a) *Symbols for quantities.* This part uses the following symbols and units of measure for various quantities:

Symbol	Quantity	Unit	Unit symbol	Unit in terms of SI base units
α	atomic hydrogen to carbon ratio	mole per mole	mol/mol	1.
A	area	square meter	m ²	m ² .
A	vehicle frictional load	pound force or newton	lbf or N	m·kg·s ⁻² .
a_g	acceleration of Earth's gravity	meters per second squared	m/s ²	m·s ⁻² .
A_m	calculated vehicle frictional load	pound force or newton	lbf or N	m·kg·s ⁻² .
a_0	intercept of least squares regression.			
a_1	slope of least squares regression ..			
a	acceleration	feet per second squared or meters per second squared.	ft/s ² or m/s ²	m·s ⁻² .
B	vehicle load from drag and rolling resistance.	pound force per mile per hour or newton second per meter.	lbf/(mi/hr) or N·s/m.	kg·s ⁻¹ .
β	ratio of diameters	meter per meter	m/m	1.
β	atomic oxygen to carbon ratio	mole per mole	mol/mol	1.
c	conversion factor			
C	vehicle-specific aerodynamic effects.	pound force per mile per hour squared or newton-second squared per meter squared.	lbf/(mi/hr) ² or N·s ² /m ² .	m ⁻¹ ·kg.

Symbol	Quantity	Unit	Unit symbol	Unit in terms of SI base units
$C_{\#}$	number of carbon atoms in a molecule.	$C_{\#}$	number of carbon atoms in a molecule.	$C_{\#}$.
C_d	discharge coefficient			
$C_d A$	drag area	meter squared	m^2	m^2 .
C_f	flow coefficient			
C_p	heat capacity at constant pressure	joule per kelvin	J/K	$m^2 \cdot kg \cdot s^{-2} \cdot K^{-1}$.
C_v	heat capacity at constant volume ..	joule per kelvin	J/K	$m^2 \cdot kg \cdot s^{-2} \cdot K^{-1}$.
d	diameter	meters	m	m.
D	distance	miles or meters	mi or m	m.
D	slope correlation	pound force per mile per hour squared or newton second squared per meter squared.	lbf/(mi/hr) ² or N·s ² /m ² .	$m^{-2} \cdot kg$.
DF	dilution factor			1.
e	mass weighted emission result	grams/mile	g/mi	
F	force	pound force or newton	lbf or N	$kg \cdot s^{-2}$.
f	frequency	hertz	Hz	s^{-1} .
f_n	angular speed (shaft)	revolutions per minute	r/min	$\pi \cdot 30 \cdot s^{-1}$.
FC	friction compensation error	horsepower or watt	W	$m^2 \cdot kg \cdot s^{-3}$.
FR	road-load force	pound force or newton	lbf or N	$kg \cdot s^{-2}$.
γ	ratio of specific heats	(joule per kilogram kelvin) per (joule per kilogram kelvin).	(J/(kg·K))/(J/(kg·K)).	1.
H	ambient humidity	grams water vapor per kilogram dry air.	g H ₂ O vapor/kg dry air.	g H ₂ O vapor/kg dry air.
Δh	change in height	meters	m	m.
I	inertia	pound mass or kilogram	lbm or kg	kg.
I	current	ampere	A	A.
i	indexing variable			
IR	inertia work rating			
K	correction factor			1.
K_v	calibration coefficient		$m^4 \cdot s \cdot K^{0.5} / kg$	$m^4 \cdot kg^{-1} \cdot s \cdot K^{0.5}$.
μ	viscosity, dynamic	pascal second	Pa·s	$m^{-1} \cdot kg \cdot s^{-1}$.
M	molar mass	gram per mole	g/mol	$10^{-3} \cdot kg \cdot mol^{-1}$.
M_e	effective mass	kilogram	kg	kg.
m	mass	pound mass or kilogram	lbm or kg	kg.
N	total number in series			
n	total number of pulses in a series ..			
p	pressure	pascal	Pa	$m^{-1} \cdot kg \cdot s^{-2}$.
Δp	differential static pressure	pascal	Pa	$m^{-1} \cdot kg \cdot s^{-2}$.
p_a	saturated vapor pressure at ambient dry bulb temperature.	kilopascal	kPa	$m^{-1} \cdot kg \cdot s^{-2}$.
PF	penetration fraction			
ρ	mass density	kilogram per cubic meter	kg/m ³	$m^{-3} \cdot kg$.
R	dynamometer roll revolutions	revolutions per minute	rpm	$\pi \cdot 30^{-1} \cdot s^{-1}$.
r	ratio of pressures	pascal per pascal	Pa/Pa	1.
r^2	coefficient of determination			
$Re^{\#}$	Reynolds number			
RF	response factor			
RH	relative humidity			
S	Sutherland constant	kelvin	K	K.
SEE	standard estimate of error			
SG	specific gravity			
Δs	distance traveled during measurement interval.	meters	m	m.
T	absolute temperature	kelvin	K	K.
T	Celsius temperature	degree Celsius	°C	K-273.15.
T	torque (moment of force)	newton meter	N·m	$m^2 \cdot kg \cdot s^{-2}$.
t	time	hour or second	hr or s	s.
Δt	time interval, period, 1/frequency ...	second	s	s.
U	voltage	volt	V	$m^2 \cdot kg \cdot s^{-3} \cdot A^{-1}$.
v	speed	miles per hour or meters per second.	mi/hr or m/s	$m \cdot s^{-1}$.
V	volume	cubic meter	m ³	m ³ .
\dot{V}	flow volume rate	cubic feet per minute or cubic meter per second.	ft ³ /min or m ³ /s	$m^3 \cdot s^{-1}$.
VP	volume percent			
x	concentration of emission over a test interval.	part per million	ppm	
y	generic variable			
Z	compressibility factor			

* * * * *

■ 316. Section 1066.1010 is amended by removing the undesignated paragraph after paragraph (a) introductory text and revising paragraph (b)(1) to read as follows:

§ 1066.1010 Incorporation by reference.

* * * * *

(b) * * *

(1) SAE J1263, Road Load Measurement and Dynamometer Simulation Using Coastdown Techniques, revised March 2010, IBR approved for §§ 1066.301(b), 1066.305(a), and 1066.310(b).

* * * * *

PART 1068—GENERAL COMPLIANCE PROVISIONS FOR HIGHWAY, STATIONARY, AND NONROAD PROGRAMS

■ 317. The authority citation for part 1068 continues to read as follows:

Authority: 42 U.S.C. 7401–7671q.

Subpart A—Applicability and Miscellaneous Provisions

■ 318. Section 1068.1 is revised to read as follows:

§ 1068.1 Does this part apply to me?

(a) The provisions of this part apply to everyone with respect to the engine and equipment categories as described in this paragraph (a). They apply to everyone, including owners, operators, parts manufacturers, and persons performing maintenance. Where we identify an engine category, the provisions of this part also apply with respect to the equipment using such engines. This part 1068 applies to different engine and equipment categories as follows:

(1) This part 1068 applies to motor vehicles we regulate under 40 CFR part 86, subpart S, to the extent and in the manner specified in 40 CFR parts 85 and 86.

(2) This part 1068 applies for heavy-duty motor vehicles we regulate under 40 CFR part 1037, subject to the provisions of 40 CFR parts 85 and 1037. This includes trailers. This part 1068 applies to other heavy-duty motor vehicles and motor vehicle engines to the extent and in the manner specified in 40 CFR parts 85, 86, and 1036.

(3) This part 1068 applies to highway motorcycles we regulate under 40 CFR part 86, subparts E and F, to the extent and in the manner specified in 40 CFR parts 85 and 86.

(4) This part 1068 applies to aircraft we regulate under 40 CFR part 87 to the extent and in the manner specified in 40 CFR part 87.

(5) This part 1068 applies for locomotives that are subject to the provisions of 40 CFR part 1033. This part 1068 does not apply for locomotives or locomotive engines that were originally manufactured before July 7, 2008, and that have not been remanufactured on or after July 7, 2008.

(6) This part 1068 applies for land-based nonroad compression-ignition engines that are subject to the provisions of 40 CFR part 1039. This part 1068 does not apply for engines certified under 40 CFR part 89.

(7) This part 1068 applies for stationary compression-ignition engines certified using the provisions of 40 CFR parts 89, 94, 1039, and 1042 as described in 40 CFR part 60, subpart IIII.

(8) This part 1068 applies for marine compression-ignition engines that are subject to the provisions of 40 CFR part 1042. This part 1068 does not apply for marine compression-ignition engines certified under 40 CFR part 94.

(9) This part 1068 applies for marine spark-ignition engines that are subject to the provisions of 40 CFR part 1045. This part 1068 does not apply for marine spark-ignition engines certified under 40 CFR part 91.

(10) This part 1068 applies for large nonroad spark-ignition engines that are subject to the provisions of 40 CFR part 1048.

(11) This part 1068 applies for stationary spark-ignition engines certified using the provisions of 40 CFR part 1048 or part 1054, as described in 40 CFR part 60, subpart JJJJ.

(12) This part 1068 applies for recreational engines and vehicles, including snowmobiles, off-highway motorcycles, and all-terrain vehicles that are subject to the provisions of 40 CFR part 1051.

(13) This part applies for small nonroad spark-ignition engines that are subject to the provisions of 40 CFR part 1054. This part 1068 does not apply for nonroad spark-ignition engines certified under 40 CFR part 90.

(14) This part applies for fuel-system components installed in nonroad equipment powered by volatile liquid fuels that are subject to the provisions of 40 CFR part 1060.

(b) [Reserved]

(c) Paragraph (a) of this section identifies the parts of the CFR that define emission standards and other requirements for particular types of engines and equipment. This part 1068 refers to each of these other parts generically as the “standard-setting part.” For example, 40 CFR part 1051 is always the standard-setting part for snowmobiles. Follow the provisions of the standard-setting part if they are

different than any of the provisions in this part.

(d) Specific provisions in this part 1068 start to apply separate from the schedule for certifying engines/equipment to new emission standards, as follows:

(1) The provisions of §§ 1068.30 and 1068.310 apply for stationary spark-ignition engines built on or after January 1, 2004, and for stationary compression-ignition engines built on or after January 1, 2006.

(2) The provisions of §§ 1068.30 and 1068.235 apply for the types of nonroad engines/equipment listed in paragraph (a) of this section beginning January 1, 2004, if they are used solely for competition.

(3) The standard-setting part may specify how the provisions of this part 1068 apply for uncertified engines/equipment.

■ 319. Section 1068.10 is amended by revising the section heading to read as follows:

§ 1068.10 Confidential information.

* * * * *

■ 320. Section 1068.15 is amended by revising the section heading and paragraph (a) to read as follows:

§ 1068.15 General provisions for EPA decision-making.

(a) Not all EPA employees may represent the Agency with respect to EPA decisions under this part or the standard-setting part. Only the Administrator of the Environmental Protection Agency or an official to whom the Administrator has delegated specific authority may represent the Agency. For more information, ask for a copy of the relevant sections of the EPA Delegations Manual from the Designated Compliance Officer.

* * * * *

§ 1068.20 [Amended]

■ 321. Section 1068.20 is amended by removing paragraphs (b) and (c) and redesignating paragraphs (d) through (f) as paragraphs (b) through (d), respectively.

■ 322. Section 1068.27 is revised to read as follows:

§ 1068.27 May EPA conduct testing with my engines/equipment?

(a) As described in the standard-setting part, we may perform testing on your engines/equipment before we issue a certificate of conformity. This is generally known as confirmatory testing.

(b) If we request it, you must make a reasonable number of production-line engines or pieces of production-line

equipment available for a reasonable time so we can test or inspect them for compliance with the requirements of this chapter.

(c) If your emission-data engine/equipment or production engine/equipment requires special components for proper testing, you must promptly provide any such components to us if we ask for them.

■ 323. Section 1068.30 is revised to read as follows:

§ 1068.30 Definitions.

The following definitions apply to this part. The definitions apply to all subparts unless we note otherwise. All undefined terms have the meaning the Clean Air Act gives to them. The definitions follow:

Affiliated companies or affiliates means one of the following:

(1) For determinations related to small manufacturer allowances or other small business provisions, these terms mean all entities considered to be affiliates with your entity under the Small Business Administration's regulations in 13 CFR 121.103.

(2) For all other provisions, these terms mean all of the following:

(i) Parent companies (as defined in this section).

(ii) Subsidiaries (as defined in this section).

(iii) Subsidiaries of your parent company.

Aftertreatment means relating to a catalytic converter, particulate filter, or any other system, component, or technology mounted downstream of the exhaust valve (or exhaust port) whose design function is to reduce emissions in the engine exhaust before it is exhausted to the environment. Exhaust gas recirculation (EGR) is not aftertreatment.

Aircraft means any vehicle capable of sustained air travel more than 100 feet above the ground.

Certificate holder means a manufacturer (including importers) with a valid certificate of conformity for at least one family in a given model year, or the preceding model year. Note that only manufacturers may hold certificates. Your applying for or accepting a certificate is deemed to be your agreement that you are a manufacturer.

Clean Air Act means the Clean Air Act, as amended, 42 U.S.C. 7401–7671q.

Date of manufacture means one of the following:

(1) For engines, the date on which the crankshaft is installed in an engine block, with the following exceptions:

(i) For engines produced by secondary engine manufacturers under § 1068.262,

date of manufacture means the date the engine is received from the original engine manufacturer. You may assign an earlier date up to 30 days before you received the engine, but not before the crankshaft was installed. You may not assign an earlier date if you cannot demonstrate the date the crankshaft was installed.

(ii) Manufacturers may assign a date of manufacture at a point in the assembly process later than the date otherwise specified under this definition. For example, a manufacturer may use the build date printed on the label or stamped on the engine as the date of manufacture.

(2) For equipment, the date on which the engine is installed, unless otherwise specified in the standard-setting part. Manufacturers may alternatively assign a date of manufacture later in the assembly process.

Days means calendar days, including weekends and holidays.

Defeat device has the meaning given in the standard-setting part.

Designated Compliance Officer means one of the following:

(1) For motor vehicles regulated under 40 CFR part 86, subpart S: Director, Light-Duty Vehicle Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; complianceinfo@epa.gov; epa.gov/otaq/verify.

(2) For compression-ignition engines used in heavy-duty highway vehicles regulated under 40 CFR part 86, subpart A, and 40 CFR parts 1036 and 1037, and for nonroad and stationary compression-ignition engines or equipment regulated under 40 CFR parts 60, 1033, 1039, and 1042: Director, Diesel Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; complianceinfo@epa.gov; epa.gov/otaq/verify.

(3) Director, Gasoline Engine Compliance Center, U.S. Environmental Protection Agency, 2000 Traverwood Drive, Ann Arbor, MI 48105; nonroad-si-cert@epa.gov; epa.gov/otaq/verify, for all the following engines and vehicles:

(i) For spark-ignition engines used in heavy-duty highway vehicles regulated under 40 CFR part 86, subpart A, and 40 CFR parts 1036 and 1037,

(ii) For highway motorcycles regulated under 40 CFR part 86, subpart E.

(iii) For nonroad and stationary spark-ignition engines or equipment regulated under 40 CFR parts 60, 1045, 1048, 1051, 1054, and 1060.

Engine means an engine block with an installed crankshaft, or a gas turbine engine. The term engine does not

include engine blocks without an installed crankshaft, nor does it include any assembly of reciprocating engine components that does not include the engine block. (**Note:** For purposes of this definition, any component that is the primary means of converting an engine's energy into usable work is considered a crankshaft, whether or not it is known commercially as a crankshaft.) This includes complete and partially complete engines as follows:

(1) A complete engine is a fully assembled engine in its final configuration. In the case of equipment-based standards, an engine is not considered complete until it is installed in the equipment, even if the engine itself is fully assembled.

(2) A partially complete engine is an engine that is not fully assembled or is not in its final configuration. Except where we specify otherwise in this part or the standard-setting part, partially complete engines are subject to the same standards and requirements as complete engines. The following would be considered examples of partially complete engines:

(i) An engine that is missing certain emission-related components.

(ii) A new engine that was originally assembled as a motor-vehicle engine that will be recalibrated for use as a nonroad engine.

(iii) A new engine that was originally assembled as a land-based engine that will be modified for use as a marine propulsion engine.

(iv) A short block consisting of a crankshaft and other engine components connected to the engine block, but missing the head assembly.

(v) A long block consisting of all engine components except the fuel system and an intake manifold.

(vi) In the case of equipment-based standards, a fully functioning engine that is not yet installed in the equipment. For example, a fully functioning engine that will be installed in an off-highway motorcycle or a locomotive is considered partially complete until it is installed in the equipment.

Engine-based standard means an emission standard expressed in units of grams of pollutant per kilowatt-hour (or grams of pollutant per horsepower-hour) that applies to the engine. Emission standards are either engine-based or equipment-based. Note that engines may be subject to additional standards such as smoke standards.

Engine-based test means an emission test intended to measure emissions in units of grams of pollutant per kilowatt-hour (or grams of pollutant per horsepower-hour), without regard to

whether the standard applies to the engine or equipment. Note that some products that are subject to engine-based testing are subject to additional test requirements such as for smoke.

Engine configuration means a unique combination of engine hardware and calibration within an engine family. Engines within a single engine configuration differ only with respect to normal production variability or factors unrelated to emissions.

Engine/equipment and *engines/equipment* mean engine(s) and/or equipment depending on the context. Specifically these terms mean the following:

(1) Engine(s) when only engine-based standards apply.

(2) Engine(s) for testing issues when engine-based testing applies.

(3) Engine(s) and equipment when both engine-based and equipment-based standards apply.

(4) Equipment when only equipment-based standards apply.

(5) Equipment for testing issues when equipment-based testing applies.

Equipment means one of the following things:

(1) Any vehicle, vessel, or other type of equipment that is subject to the requirements of this part or that uses an engine that is subject to the requirements of this part. An installed engine is part of the equipment. Motor vehicle trailers are a type of equipment that is subject to the requirements of this part.

(2) Fuel-system components that are subject to an equipment-based standard under this chapter. Installed fuel-system components are also considered part of the engine/equipment to which they are attached.

Equipment-based standard means an emission standard that applies to the equipment in which an engine is used or to fuel-system components associated with an engine, without regard to how the emissions are measured. If equipment-based standards apply, we require that the equipment or fuel-system components be certified rather than just the engine. Emission standards are either engine-based or equipment-based. For example, recreational vehicles we regulate under 40 CFR part 1051 are subject to equipment-based standards even if emission measurements are based on engine operation alone.

Excluded means relating to engines/equipment that are not subject to emission standards or other requirements because they do not meet the definitions or other regulatory provisions that define applicability. For example, a non-stationary engine that is

used solely for off-highway competition is excluded from the requirements of this part because it meets neither the definition of "motor vehicle engine" nor "nonroad engine" under section 216 of the Clean Air Act.

Exempted means relating to engines/equipment that are subject to certain standards or other requirements, but are not required to meet those standards or requirements, subject to one or more qualifying conditions. Exempted engines/equipment must conform to regulatory conditions specified for an exemption in this part 1068 or in the standard-setting part. Engines/equipment exempted with respect to a certain tier of standards may be required to comply with an earlier tier of standards as a condition of the exemption; for example, engines exempted with respect to Tier 3 standards may be required to comply with Tier 1 or Tier 2 standards.

Family means engine family or emission family, as applicable, under the standard-setting part.

Final deteriorated test result has the meaning given in the standard-setting part. If it is not defined in the standard-setting part, it means the emission level that results from applying all appropriate adjustments (such as deterioration factors) to the measured emission result of the emission-data engine.

Gas turbine engine means anything commercially known as a gas turbine engine or any collection of assembled engine components that is substantially similar to engines commercially known as gas turbine engines. For example, a jet engine is a gas turbine engine. Gas turbine engines may be complete or partially complete. Turbines that rely on external combustion such as steam engines are not gas turbine engines.

Good engineering judgment means judgments made consistent with generally accepted scientific and engineering principles and all available relevant information. See § 1068.5.

Manufacturer has the meaning given in section 216(1) of the Clean Air Act (42 U.S.C. 7550(1)). In general, this term includes any person who manufactures or assembles an engine or piece of equipment for sale in the United States or otherwise introduces a new engine or piece of equipment into U.S. commerce. This includes importers that import new engines or new equipment into the United States for resale. It also includes secondary engine manufacturers.

Model year has the meaning given in the standard-setting part. Unless the standard-setting part specifies otherwise, model year for individual engines/equipment is based on the date

of manufacture or a later stage in the assembly process determined by the manufacturer, subject to the limitations described in §§ 1068.103 and 1068.360. The model year of a new engine that is neither certified nor exempt is deemed to be the calendar year in which it is sold, offered for sale, imported, or delivered or otherwise introduced into U.S. commerce.

Motor vehicle has the meaning given in 40 CFR 85.1703.

New has the meaning we give it in the standard-setting part. Note that in certain cases, used and remanufactured engines/equipment may be "new" engines/equipment.

Nonroad engine means:

(1) Except as discussed in paragraph (2) of this definition, a nonroad engine is an internal combustion engine that meets any of the following criteria:

(i) It is (or will be) used in or on a piece of equipment that is self-propelled or serves a dual purpose by both propelling itself and performing another function (such as garden tractors, off-highway mobile cranes and bulldozers).

(ii) It is (or will be) used in or on a piece of equipment that is intended to be propelled while performing its function (such as lawnmowers and string trimmers).

(iii) By itself or in or on a piece of equipment, it is portable or transportable, meaning designed to be and capable of being carried or moved from one location to another. Indicia of transportability include, but are not limited to, wheels, skids, carrying handles, dolly, trailer, or platform.

(2) An internal combustion engine is not a nonroad engine if it meets any of the following criteria:

(i) The engine is used to propel a motor vehicle, an aircraft, or equipment used solely for competition.

(ii) The engine is regulated under 40 CFR part 60, (or otherwise regulated by a federal New Source Performance Standard promulgated under section 111 of the Clean Air Act (42 U.S.C. 7411)). Note that this criterion does not apply for engines meeting any of the criteria of paragraph (1) of this definition that are voluntarily certified under 40 CFR part 60.

(iii) The engine otherwise included in paragraph (1)(iii) of this definition remains or will remain at a location for more than 12 consecutive months or a shorter period of time for an engine located at a seasonal source. A location is any single site at a building, structure, facility, or installation. For any engine (or engines) that replaces an engine at a location and that is intended to perform the same or similar function as the engine replaced, include the time period

of both engines in calculating the consecutive time period. An engine located at a seasonal source is an engine that remains at a seasonal source during the full annual operating period of the seasonal source. A seasonal source is a stationary source that remains in a single location on a permanent basis (*i.e.*, at least two years) and that operates at that single location approximately three months (or more) each year. See § 1068.31 for provisions that apply if the engine is removed from the location.

Operating hours means:

(1) For engine and equipment storage areas or facilities, times during which people other than custodians and security personnel are at work near, and can access, a storage area or facility.

(2) For other areas or facilities, times during which an assembly line operates or any of the following activities occurs:

(i) Testing, maintenance, or service accumulation.

(ii) Production or compilation of records.

(iii) Certification testing.

(iv) Translation of designs from the test stage to the production stage.

(v) Engine or equipment manufacture or assembly.

Parent company means any entity that has a controlling ownership of another company. Note that the standard-setting part may treat a partial owner as a parent company even if it does not have controlling ownership of a company.

Piece of equipment means any vehicle, vessel, locomotive, aircraft, or other type of equipment equipped with engines to which this part applies.

Placed into service means used for its intended purpose. Engines/equipment do not qualify as being “placed into service” based on incidental use by a manufacturer or dealer.

Reasonable technical basis means information that would lead a person familiar with engine design and function to reasonably believe a conclusion related to compliance with the requirements of this part. For example, it would be reasonable to believe that parts performing the same function as the original parts (and to the same degree) would control emissions to the same degree as the original parts. Note that what is a reasonable basis for a person without technical training might not qualify as a reasonable technical basis.

Relating to as used in this section means relating to something in a specific, direct manner. This expression is used in this section only to define terms as adjectives and not to broaden the meaning of the terms. Note that “relating to” is used in the same manner as in the standard-setting parts.

Replacement engine means an engine exempted as a replacement engine under § 1068.240.

Revoke means to terminate the certificate or an exemption for a family. If we revoke a certificate or exemption, you must apply for a new certificate or exemption before continuing to introduce the affected engines/equipment into U.S. commerce. This does not apply to engines/equipment you no longer possess.

Secondary engine manufacturer means anyone who produces a new engine by modifying a complete or partially complete engine that was made by a different company. For the purpose of this definition, “modifying” does not include making changes that do not remove an engine from its original certified configuration. Secondary engine manufacturing includes, for example, converting automotive engines for use in industrial applications, or land-based engines for use in marine applications. This applies whether it involves a complete or partially complete engine and whether the engine was previously certified to emission standards or not.

(1) Manufacturers controlled by the manufacturer of the base engine (or by an entity that also controls the manufacturer of the base engine) are not secondary engine manufacturers; rather, both entities are considered to be one manufacturer for purposes of this part.

(2) This definition applies equally to equipment manufacturers that modify engines. Also, equipment manufacturers that certify to equipment-based standards using engines produced by another company are deemed to be secondary engine manufacturers.

(3) Except as specified in paragraph (2) of this definition, companies importing complete engines into the United States are not secondary engine manufacturers regardless of the procedures and relationships between companies for assembling the engines.

Small business means either of the following:

(1) A company that qualifies under the standard-setting part for special provisions for small businesses or small-volume manufacturers.

(2) A company that qualifies as a small business under the regulations adopted by the Small Business Administration at 13 CFR 121.201 if the standard-setting part does not establish such qualifying criteria.

Standard-setting part means a part in the Code of Federal Regulations that defines emission standards for a particular engine and/or piece of equipment (see § 1068.1(a)). For example, the standard-setting part for

marine spark-ignition engines is 40 CFR part 1045. For provisions related to evaporative emissions, the standard-setting part may be 40 CFR part 1060, as specified in 40 CFR 1060.1.

Subsidiary means an entity that is owned or controlled by a parent company.

Sulfur-sensitive technology means an emission control technology that experiences a significant drop in emission control performance or emission-system durability when an engine is operated on low-sulfur diesel fuel (*i.e.*, fuel with a sulfur concentration of 300 to 500 ppm) as compared to when it is operated on ultra low-sulfur diesel fuel (*i.e.*, fuel with a sulfur concentration less than 15 ppm). Exhaust gas recirculation is not a sulfur-sensitive technology.

Suspend means to temporarily discontinue the certificate or an exemption for a family. If we suspend a certificate, you may not sell, offer for sale, or introduce or deliver into commerce in the United States or import into the United States engines/equipment from that family unless we reinstate the certificate or approve a new one. This also applies if we suspend an exemption, unless we reinstate the exemption.

Ultimate purchaser means the first person who in good faith purchases a new engine or new piece of equipment for purposes other than resale.

United States, in a geographic sense, means the States, the District of Columbia, the Commonwealth of Puerto Rico, the Commonwealth of the Northern Mariana Islands, Guam, American Samoa, and the U.S. Virgin Islands.

U.S.-directed production volume has the meaning given in the standard-setting part.

Void means to invalidate a certificate or an exemption *ab initio* (“from the beginning”). If we void a certificate, all the engines/equipment introduced into U.S. commerce under that family for that model year are considered uncertified (or nonconforming) and are therefore not covered by a certificate of conformity, and you are liable for all engines/equipment introduced into U.S. commerce under the certificate and may face civil or criminal penalties or both. This applies equally to all engines/equipment in the family, including engines/equipment introduced into U.S. commerce before we voided the certificate. If we void an exemption, all the engines/equipment introduced into U.S. commerce under that exemption are considered uncertified (or nonconforming), and you are liable for engines/equipment introduced into U.S.

commerce under the exemption and may face civil or criminal penalties or both. You may not sell, offer for sale, or introduce or deliver into commerce in the United States or import into the United States any additional engines/equipment using the voided exemption.

Voluntary emission recall means a repair, adjustment, or modification program voluntarily initiated and conducted by a manufacturer to remedy any emission-related defect for which engine owners have been notified.

We (us, our) means the Administrator of the Environmental Protection Agency and any authorized representatives.

■ 324. Section 1068.31 is amended by revising the section heading, the introductory text, and paragraph (c) to read as follows:

§ 1068.31 Changing the status of nonroad or stationary engines under the definition of “nonroad engine”.

This section specifies the provisions that apply when an engine previously used in a nonroad application is subsequently used in an application other than a nonroad application, or when an engine previously used in a stationary application (*i.e.*, an engine that was not used as a nonroad engine and that was not used to propel a motor vehicle, an aircraft, or equipment used solely for competition) is moved.

* * * * *

(c) A stationary engine does not become a new nonroad engine if it is moved but continues to meet the criteria specified in paragraph (2)(iii) in the definition of “nonroad engine” in § 1068.30 in its new location. For example, a transportable engine that is used in a single specific location for 18 months and is later moved to a second specific location where it will remain for at least 12 months is considered to be a stationary engine in both locations. Note that for stationary engines that are neither portable nor transportable in actual use, the residence-time restrictions in the definition of “nonroad engine” generally do not apply.

* * * * *

■ 325. Section 1068.32 is added to read as follows:

§ 1068.32 Explanatory terms.

This section explains how certain phrases and terms are used in 40 CFR parts 1000 through 1099, especially those used to clarify and explain regulatory provisions.

(a) *Types of provisions.* The term “provision” includes all aspects of the regulations in this subchapter U. As described in this section, regulatory

provisions include standards, requirements, prohibitions, and allowances, along with a variety of other types of provisions. In certain cases, we may use these terms to apply to some but not all of the provisions of a part or section. For example, we may apply the allowances of a section for certain engines, but not the requirements. We may also apply all provisions except the requirements and prohibitions.

(1) A standard is a requirement established by regulation that limits the emissions of air pollutants. Examples of standards include numerical emission standards (such as 0.01 g/kW-hr) and design standards (such as a closed crankcase standard). Compliance with or conformance to a standard is a specific type of requirement, and in some cases a standard may be discussed as a requirement. Thus, a statement about the requirements of a part or section also applies with respect to the standards of the part or section.

(2) The regulations in subchapter U of this chapter apply other requirements in addition to standards. For example, manufacturers are required to keep records and provide reports to EPA.

(3) While requirements state what someone must do, prohibitions state what someone may not do. Prohibitions are often referred to as prohibited acts or prohibited actions. Most penalties apply for violations of prohibitions. A list of prohibitions may therefore include the failure to meet a requirement as a prohibited action.

(4) Allowances provide some form of relief from requirements. This may include provisions delaying implementation, establishing exemptions or test waivers, or creating alternative compliance options. Allowances may be conditional. For example, we may exempt you from certain requirements on the condition that you meet certain other requirements.

(5) The regulations in subchapter U of this chapter also include important provisions that are not standards, requirements, prohibitions, or allowances, such as definitions.

(6) Engines/equipment are generally considered “*subject to*” a specific provision if that provision applies, or if it does not apply because of an exemption authorized under the regulation. For example, locomotives are subject to the provisions of 40 CFR part 1033 even if they are exempted from the standards of part 1033.

(b) *Singular and plural.* Unless stated otherwise or unless it is clear from the regulatory context, provisions written in singular form include the plural form and provisions written in plural form

include the singular form. For example, the statement “The manufacturer must keep this report for three years” is equivalent to “The manufacturers must keep these reports for three years.”

(c) *Inclusive lists.* Lists in the regulations in subchapter U of this chapter prefaced by “including” or “this includes” are not exhaustive. The terms “including” and “this includes” should be read to mean “including but not limited to” and “this includes but is not limited to”. For example, the phrase “including small manufacturers” does not exclude large manufacturers. However, prescriptive statements to “include” specific items (such as those related to recordkeeping and reporting requirements) may be exhaustive.

(d) *Notes.* Statements that begin with “Note:” or “Note that” are intended to clarify specific regulatory provisions stated elsewhere in the regulations in subchapter U of this chapter. By themselves, such statements are not intended to specify regulatory requirements. Such statements are typically used for regulatory text that, while legally sufficient to specify a requirement, may be misunderstood by some readers. For example, the regulations might note that a word is defined elsewhere in the regulations to have a specific meaning that may be either narrower or broader than some readers might assume.

(e) *Examples.* Examples provided in the regulations in subchapter U of this chapter are typically introduced by either “for example” or “such as”. Specific examples given in the regulations do not necessarily represent the most common examples. The regulations may specify examples conditionally (that is, specifying that they are applicable only if certain criteria or conditions are met). Lists of examples cannot be presumed to be exhaustive lists.

(f) *Generally and typically.* Statements that begin with “generally”, “in general”, or “typically” should not be read to apply universally or absolutely. Rather they are intended to apply for the most common circumstances.

“Generally” and “typically” statements may be identified as notes as described in paragraph (d) of this section.

(g) *Unusual circumstances.* The regulations in subchapter U of this chapter specify certain allowances that apply “in unusual circumstances”. While it is difficult to precisely define what “unusual circumstances” means, this generally refers to specific circumstances that are both rare and unforeseeable. For example, a severe hurricane in the northeastern United States may be considered to be an

unusual circumstance, while a less severe hurricane in the southeastern United States may not be. Where the regulations limit an allowance to unusual circumstances, manufacturers and others should not presume that such an allowance will be available to them. Provisions related to unusual circumstances may be described using the phrase “normal circumstances”, which are those circumstances that are not unusual circumstances.

(h) *Exceptions and other specifications.* Regulatory provisions may be expressed as a general prohibition, requirement, or allowance that is modified by other regulatory text. Such provisions may include phrases such as “unless specified otherwise”, “except as specified”, or “as specified in this section”. It is important that the exceptions and the more general statement be considered together. This regulatory construct is intended to allow the core requirement or allowance to be stated in simple, clear sentences, rather than more precise and comprehensive sentences that may be misread. For example, where an action is prohibited in most but not all circumstances, the provision may state that you may not take the action, “except as specified in this section.” The exceptions could then be stated in subsequent regulatory text.

■ 326. Revise the section heading for § 1068.35 to read as follows:

§ 1068.35 Symbols, acronyms, and abbreviations.

* * * * *

■ 327. Section 1068.40 is amended by revising the section heading and paragraph (a) and removing paragraph (c).

The revisions read as follows:

§ 1068.40 Special provisions for implementing changes in the regulations in this part.

(a) During the 12 months following the effective date of any change in the provisions of this part, you may ask to apply the previously applicable provisions. Note that the effective date is generally 30 or 60 days after publication in the **Federal Register**, as noted in the final rule. We will generally approve your request if you can demonstrate that it would be impractical to comply with the new requirements. We may consider the potential for adverse environmental impacts in our decision. Similarly, in unusual circumstances, you may ask for relief under this paragraph (a) from new requirements that apply under the standard-setting part.

* * * * *

■ 328. Section 1068.45 is amended by revising paragraph (e) and adding paragraphs (g) and (h) to read as follows:

§ 1068.45 General labeling provisions.

* * * * *

(e) *Prohibitions against removing labels.* As specified in § 1068.101(b)(7), removing permanent labels is prohibited except for certain circumstances. Removing temporary or removable labels prematurely is also prohibited by § 1068.101(b)(7).

* * * * *

(g) *Date format.* If you use a coded approach to identify the engine/equipment's date of manufacture, describe or interpret the code in your application for certification.

(h) *Branding.* The following provisions apply if you identify the name and trademark of another company instead of your own on your emission control information label, as provided in the standard-setting part:

(1) You must have a contractual agreement with the other company that obligates that company to take the following steps:

(i) Meet the emission warranty requirements that apply under the standard-setting part. This may involve a separate agreement involving reimbursement of warranty-related expenses.

(ii) Report all warranty-related information to the certificate holder.

(2) In your application for certification, identify the company whose trademark you will use.

(3) You remain responsible for meeting all the requirements of this chapter, including warranty and defect-reporting provisions.

■ 329. Section 1068.95 is revised to read as follows:

§ 1068.95 Incorporation by reference.

(a) Certain material is incorporated by reference into this part with the approval of the Director of the Federal Register under 5 U.S.C. 552(a) and 1 CFR part 51. To enforce any edition other than that specified in this section, the Environmental Protection Agency must publish a document in the **Federal Register** and the material must be available to the public. All approved materials are available for inspection at the Air and Radiation Docket and Information Center (Air Docket) in the EPA Docket Center (EPA/DC) at Rm. 3334, EPA West Bldg., 1301 Constitution Ave. NW., Washington, DC. The EPA/DC Public Reading Room hours of operation are 8:30 a.m. to 4:30 p.m., Monday through Friday, excluding legal holidays. The telephone number of the EPA/DC Public Reading Room is

(202) 566-1744, and the telephone number for the Air Docket is (202) 566-1742. These approved materials are also available for inspection at the National Archives and Records Administration (NARA). For information on the availability of this material at NARA, call (202) 741-6030 or go to http://www.archives.gov/federal_register/code_of_federal_regulations/ibr_locations.html. In addition, these materials are available from the sources listed below.

(b) SAE International, 400 Commonwealth Dr., Warrendale, PA 15096-0001, (724) 776-4841, or <http://www.sae.org>;

(1) SAE J1930, Electrical/Electronic Systems Diagnostic Terms, Definitions, Abbreviations, and Acronyms, revised October 2008 (“SAE J1930”), IBR approved for § 1068.45(f).

(2) [Reserved]

Subpart B—Prohibited Actions and Related Requirements

■ 330. Section 1068.101 is amended by revising the introductory text and paragraphs (a)(1) through (3), (b)(1) introductory text, (b)(2), (b)(3), (b)(4), (b)(5) introductory text, (b)(6), and (h) introductory text to read as follows:

§ 1068.101 What general actions does this regulation prohibit?

This section specifies actions that are prohibited and the maximum civil penalties that we can assess for each violation in accordance with 42 U.S.C. 7522 and 7524. The maximum penalty values listed in paragraphs (a) and (b) of this section and in § 1068.125 apply as of August 1, 2016. As described in paragraph (h) of this section, these maximum penalty limits are different for earlier violations and they may be adjusted as set forth in 40 CFR part 19.

(a) * * *

(1) *Introduction into commerce.* You may not sell, offer for sale, or introduce or deliver into commerce in the United States or import into the United States any new engine/equipment after emission standards take effect for the engine/equipment, unless it is covered by a valid certificate of conformity for its model year and has the required label or tag. You also may not take any of the actions listed in the previous sentence with respect to any equipment containing an engine subject to this part's provisions unless the engine is covered by a valid certificate of conformity for its model year and has the required engine label or tag. We may assess a civil penalty up to \$44,539 for each engine or piece of equipment in violation.

(i) For purposes of this paragraph (a)(1), a valid certificate of conformity is one that applies for the same model year as the model year of the equipment (except as allowed by § 1068.105(a)), covers the appropriate category or subcategory of engines/equipment (such as locomotive or sterndrive/inboard Marine SI or nonhandheld Small SI), and conforms to all requirements specified for equipment in the standard-setting part. Engines/equipment are considered not covered by a certificate unless they are in a configuration described in the application for certification.

(ii) The prohibitions of this paragraph (a)(1) also apply for new engines you produce to replace an older engine in a piece of equipment, except that the engines may qualify for the replacement-engine exemption in § 1068.240.

(iii) The prohibitions of this paragraph (a)(1) also apply for new engines that will be installed in equipment subject to equipment-based standards, except that the engines may qualify for an exemption under § 1068.260(c) or § 1068.262.

(iv) Where the regulations specify that you are allowed to introduce engines/equipment into U.S. commerce without a certificate of conformity, you may take any of the otherwise prohibited actions specified in this paragraph (a)(1) with respect to those engines/equipment.

(2) *Reporting and recordkeeping.* This chapter requires you to record certain types of information to show that you meet our standards. You must comply with these requirements to make and maintain required records (including those described in § 1068.501). You may not deny us access to your records or the ability to copy your records if we have the authority to see or copy them. Also, you must give us complete and accurate reports and information without delay as required under this chapter. Failure to comply with the requirements of this paragraph is prohibited. We may assess a civil penalty up to \$44,539 for each day you are in violation. In addition, knowingly submitting false information is a violation of 18 U.S.C. 1001, which may involve criminal penalties and up to five years imprisonment.

(3) *Testing and access to facilities.* You may not keep us from entering your facility to test engines/equipment or inspect if we are authorized to do so. Also, you must perform the tests we require (or have the tests done for you). Failure to perform this testing is prohibited. We may assess a civil penalty up to \$44,539 for each day you are in violation.

(b) * * *

(1) *Tampering.* You may not remove or render inoperative any device or element of design installed on or in engines/equipment in compliance with the regulations prior to its sale and delivery to the ultimate purchaser. You also may not knowingly remove or render inoperative any such device or element of design after such sale and delivery to the ultimate purchaser. This includes, for example, operating an engine without a supply of appropriate quality urea if the emission control system relies on urea to reduce NO_x emissions or the use of incorrect fuel or engine oil that renders the emission control system inoperative. Section 1068.120 describes how this applies to rebuilding engines. See the standard-setting part, which may include additional provisions regarding actions prohibited by this requirement. For a manufacturer or dealer, we may assess a civil penalty up to \$44,539 for each engine or piece of equipment in violation. For anyone else, we may assess a civil penalty up to \$4,454 for each engine or piece of equipment in violation. This prohibition does not apply in any of the following situations:

* * * * *

(2) *Defeat devices.* You may not knowingly manufacture, sell, offer to sell, or install, any component that bypasses, impairs, defeats, or disables the control of emissions of any regulated pollutant, except as explicitly allowed by the standard-setting part. We may assess a civil penalty up to \$4,454 for each component in violation.

(3) *Stationary engines.* For an engine that is excluded from any requirements of this chapter because it is a stationary engine, you may not move it or install it in any mobile equipment except as allowed by the provisions of this chapter. You may not circumvent or attempt to circumvent the residence-time requirements of paragraph (2)(iii) of the nonroad engine definition in § 1068.30. Anyone violating this paragraph (b)(3) is deemed to be a manufacturer in violation of paragraph (a)(1) of this section. We may assess a civil penalty up to \$44,539 for each engine or piece of equipment in violation.

(4) *Competition engines/equipment.* (i) For uncertified engines/equipment that are excluded or exempted as new engines/equipment from any requirements of this chapter because they are to be used solely for competition, you may not use any of them in a manner that is inconsistent with use solely for competition. Anyone violating this paragraph (b)(4)(i) is

deemed to be a manufacturer in violation of paragraph (a)(1) of this section. We may assess a civil penalty up to \$44,539 for each engine or piece of equipment in violation. (ii) For certified nonroad engines/equipment that qualify for exemption from the tampering prohibition as described in § 1068.235 because they are to be used solely for competition, you may not use any of them in a manner that is inconsistent with use solely for competition. Anyone violating this paragraph (b)(4)(ii) is in violation of paragraph (b)(1) or (2) of this section.

(5) *Importation.* You may not import an uncertified engine or piece of equipment if it is defined to be new in the standard-setting part with a model year for which emission standards applied. Anyone violating this paragraph (b)(5) is deemed to be a manufacturer in violation of paragraph (a)(1) of this section. We may assess a civil penalty up to \$44,539 for each engine or piece of equipment in violation. Note the following:

* * * * *

(6) *Warranty, recall, and maintenance instructions.* You must meet your obligation to honor your emission-related warranty under § 1068.115, including any commitments you identify in your application for certification. You must also fulfill all applicable requirements under subpart F of this part related to emission-related defects and recalls. You must also provide emission-related installation and maintenance instructions as described in the standard-setting part. Failure to meet these obligations is prohibited. Also, except as specifically provided by regulation, you are prohibited from directly or indirectly communicating to the ultimate purchaser or a later purchaser that the emission-related warranty is valid only if the owner has service performed at authorized facilities or only if the owner uses authorized parts, components, or systems. We may assess a civil penalty up to \$44,539 for each engine or piece of equipment in violation.

* * * * *

(h) The maximum penalty values listed in paragraphs (a) and (b) of this section and in § 1068.125 apply as of August 1, 2016. Maximum penalty values for earlier violations are published in 40 CFR part 19. Maximum penalty limits may be adjusted after August 1, 2016 based on the Consumer Price Index. The specific regulatory provisions for changing the maximum penalties, published in 40 CFR part 19, reference the applicable U.S. Code citation on which the prohibited action

is based. The following table is shown here for informational purposes:

* * * * *

■ 331. Section 1068.103 is revised to read as follows:

§ 1068.103 Provisions related to the duration and applicability of certificates of conformity.

(a) Engines/equipment covered by a certificate of conformity are limited to those that are produced during the period specified in the certificate and conform to the specifications described in the certificate and the associated application for certification. For the purposes of this paragraph (a), “specifications” includes the emission control information label and any conditions or limitations identified by the manufacturer or EPA. For example, if the application for certification specifies certain engine configurations, the certificate does not cover any configurations that are not specified. We may ignore any information provided in the application that we determine is not relevant to a demonstration of compliance with applicable regulations, such as your projected production volumes in many cases.

(b) Unless the standard-setting part specifies otherwise, determine the production period corresponding to each certificate of conformity as specified in this paragraph (b). In general, the production period is the manufacturer’s annual production period identified as a model year.

(1) For engines/equipment subject to emission standards based on model years, the first day of the annual production period can be no earlier than January 2 of the calendar year preceding the year for which the model year is named, or the earliest date of manufacture for any engine/equipment in the engine family, whichever is later. The last day of the annual production period can be no later than December 31 of the calendar year for which the model year is named or the latest date of manufacture for any engine/equipment in the engine family, whichever is sooner. Note that this approach limits how you can designate a model year for your engines/equipment; however, it does not limit your ability to meet more stringent emission standards early where this is permitted in the regulation.

(2) For fuel-system components certified to evaporative emission standards based on production periods rather than model years, the production period is either the calendar year or a longer period we specify consistent with the manufacturer’s normal production practices.

(c) A certificate of conformity will not cover engines/equipment you produce with a date of manufacture earlier than the date you submit the application for certification for the family. You may start to produce engines/equipment after you submit an application for certification and before the effective date of a certificate of conformity, subject to the following conditions:

(1) The engines/equipment must conform in all material respects to the engines/equipment described in your application. Note that if we require you to modify your application, you must ensure that all engines/equipment conform to the specifications of the modified application.

(2) The engines/equipment may not be sold, offered for sale, introduced into U.S. commerce, or delivered for introduction into U.S. commerce before the effective date of the certificate of conformity.

(3) You must notify us in your application for certification that you plan to use the provisions of this paragraph (c) and when you intend to start production. If the standard-setting part specifies mandatory testing for production-line engines, you must start testing as directed in the standard-setting part based on your actual start of production, even if that occurs before we approve your certification. You must also agree to give us full opportunity to inspect and/or test the engines/equipment during and after production. For example, we must have the opportunity to specify selective enforcement audits as allowed by the standard-setting part and the Clean Air Act as if the engines/equipment were produced after the effective date of the certificate.

(4) See § 1068.262 for special provisions that apply for secondary engine manufacturers receiving shipment of partially complete engines before the effective date of a certificate.

(d) The prohibition in § 1068.101(a)(1) against offering to sell engines/equipment without a valid certificate of conformity generally does not apply for engines/equipment that have not yet been produced. You may contractually agree to produce engines/equipment before obtaining the required certificate of conformity. This is intended to allow manufacturers of low-volume products to establish a sufficient market for engines/equipment before going through the effort to certify.

(e) Engines/equipment with a date of manufacture after December 31 of the calendar year for which a model year is named are not covered by the certificate of conformity for that model year. You must submit an application for a new

certificate of conformity demonstrating compliance with applicable standards even if the engines/equipment are identical to those with a date of manufacture before December 31.

(f) The flexible approach to naming the annual production period described in paragraph (b)(1) of this section is intended to allow you to introduce new products at any point during the year. This is based on the expectation that production periods generally run on consistent schedules from year to year. You may not use this flexibility to arrange your production periods such that you can avoid annual certification.

(g) An engine is generally assigned a model year based on its date of manufacture, which is typically based on the date the crankshaft is installed in the engine (see § 1068.30). You may not circumvent the provisions of § 1068.101(a)(1) by stockpiling engines with a date of manufacture before new or changed emission standards take effect by deviating from your normal production and inventory practices. (For purposes of this paragraph (g), normal production and inventory practices means those practices you typically use for similar families in years in which emission standards do not change. We may require you to provide us routine production and inventory records that document your normal practices for the preceding eight years.) For most engines you should plan to complete the assembly of an engine of a given model year into its certified configuration within the first week after the end of the model year if new emission standards start to apply in that model year. For special circumstances it may be appropriate for your normal business practice to involve more time. For engines with per-cylinder displacement below 2.5 liters, if new emission standards start to apply in a given year, we would consider an engine not to be covered by a certificate of conformity for the preceding model year if the engine is not assembled in a compliant configuration within 30 days after the end of the model year for that engine family. (**Note:** an engine is considered “in a compliant configuration” without being fully assembled if § 1068.260(a) or (b) authorizes shipment of the engine without certain components.) For example, in the case where new standards apply in the 2010 model year, and your normal production period is based on the calendar year, you must complete the assembly of all your 2009 model year engines before January 31, 2010, or an earlier date consistent with your normal production and inventory practices. For engines with per-cylinder displacement at or above 2.5 liters, this

time may not exceed 60 days. Note that for the purposes of this paragraph (g), an engine shipped under § 1068.261 is deemed to be a complete engine. Note also that § 1068.245 allows flexibility for additional time in unusual circumstances. Note finally that disassembly of complete engines and reassembly (such as for shipment) does not affect the determination of model year; the provisions of this paragraph (g) apply based on the date on which initial assembly is complete.

(h) This paragraph (h) describes the effect of suspending, revoking, or voiding a certificate of conformity. See the definitions of “suspend,” “revoke,” and “void” in § 1068.30. Engines/equipment produced at a time when the otherwise applicable certificate of conformity has been suspended or revoked are not covered by a certificate of conformity. Where a certificate of conformity is void, all engines/equipment produced under that certificate of conformity are not and were not covered by a certificate of conformity. In cases of suspension, engines/equipment will be covered by a certificate only if they are produced after the certificate is reinstated or a new certificate is issued. In cases of revocation and voiding, engines/equipment will be covered by a certificate only if they are produced after we issue a new certificate. 42 U.S.C. 7522(a)(1) and § 1068.101(a)(1) prohibit selling, offering for sale, introducing into commerce, delivering for introduction into commerce, and importing engines/equipment that are not covered by a certificate of conformity, and they prohibit anyone from causing another to violate these prohibitions.

(i) You may transfer a certificate to another entity only in the following cases:

(1) You may transfer a certificate to a parent company, including a parent company that purchases your company after we have issued your certificate.

(2) You may transfer a certificate to a subsidiary including a subsidiary you purchase after we have issued your certificate.

(3) You may transfer a certificate to a subsidiary of your parent company.

■ 332. Section 1068.105 is amended by revising paragraphs (a) and (c)(2) to read as follows:

§ 1068.105 What other provisions apply to me specifically if I manufacture equipment needing certified engines?

(a) *Transitioning to new engine-based standards.* If new engine-based emission standards apply in a given model year,

your equipment produced in that calendar year (or later) must have engines that are certified to the new standards, except that you may continue to use up normal inventories of engines that were built before the date of the new or changed standards. For purposes of this paragraph (a), normal inventory applies for engines you possess and engines from your engine supplier's normal inventory. (**Note:** this paragraph (a) does not apply in the case of new remanufacturing standards.) We may require you and your engine suppliers to provide us routine production and/or inventory records that document your normal practices for the preceding eight years. For example, if you have records documenting that your normal inventory practice is to keep on hand a one-month supply of engines based on your upcoming production schedules, and a new tier of standards starts to apply for the 2015 model year, you may order engines consistent with your normal inventory requirements late in the engine manufacturer's 2014 model year and install those engines in your equipment consistent with your normal production schedule. Also, if your model year starts before the end of the calendar year preceding new standards, you may use engines from the previous model year for those units you completely assemble before January 1 of the year that new standards apply. If emission standards for the engine do not change in a given model year, you may continue to install engines from the previous model year without restriction (or any earlier model year for which the same standards apply). You may not circumvent the provisions of § 1068.101(a)(1) by stockpiling engines that were built before new or changed standards take effect. Similarly, you may not circumvent the provisions of § 1068.101(a)(1) by knowingly installing engines that were stockpiled by engine suppliers in violation of § 1068.103(f). Note that this allowance does not apply for equipment subject to equipment-based standards. See 40 CFR 1060.601 for similar provisions that apply for equipment subject to evaporative emission standards. Note that the standard-setting part may impose further restrictions on using up inventories of engines from an earlier model year under this paragraph (a).

* * * * *

(c) * * *

(2) Permanently attach the duplicate label to your equipment by securing it to a part needed for normal operation and not normally requiring replacement. Make sure an average person can easily read it. Note that attaching an inaccurate

duplicate label may be a violation of § 1068.101(b)(7).

* * * * *

■ 333. Section 1068.110 is amended by revising the section heading and paragraph (d) to read as follows:

§ 1068.110 Other provisions for engines/equipment in service.

* * * * *

(d) *Defeat devices.* We may test components, engines, and equipment to investigate potential defeat devices. We may also require the manufacturer to do this testing. If we choose to investigate one of your designs, we may require you to show us that a component is not a defeat device, and that an engine/equipment does not have a defeat device. To do this, you may have to share with us information regarding test programs, engineering evaluations, design specifications, calibrations, on-board computer algorithms, and design strategies. It is a violation of the Clean Air Act for anyone to make, install or use defeat devices as described in § 1068.101(b)(2) and the standard-setting part.

* * * * *

■ 334. Section 1068.115 is amended by revising the section heading to read as follows:

§ 1068.115 What are manufacturers' emission-related warranty requirements?

* * * * *

■ 335. Section 1068.120 is amended by revising the section heading and paragraph (f) to read as follows:

§ 1068.120 Requirements for rebuilding engines.

* * * * *

(f) A rebuilt engine or other used engine may replace a certified engine in a piece of equipment only if the engine was built and/or rebuilt to a certified configuration meeting equivalent or more stringent emission standards. Note that a certified configuration would generally include more than one model year. A rebuilt engine being installed that is from the same model year or a newer model year than the engine being replaced meets this requirement. The following examples illustrate the provisions of this paragraph (f):

(1) In most cases, you may use a rebuilt Tier 2 engine to replace a Tier 1 engine or another Tier 2 engine.

(2) You may use a rebuilt Tier 1 engine to replace a Tier 2 engine if the two engines differ only with respect to model year or other characteristics unrelated to emissions since such engines would be considered to be in the same configuration. This may occur if the Tier 1 engine had emission levels

below the Tier 2 standards or if the Tier 2 engine was certified with a Family Emission Limit for calculating emission credits.

(3) You may use a rebuilt engine that originally met the Tier 1 standards without certification, as provided under § 1068.265, to replace a certified Tier 1 engine. This may occur for engines produced under a Transition Program for Equipment Manufacturers such as that described in 40 CFR 1039.625.

(4) You may never replace a certified engine with an engine rebuilt to a configuration that does not meet EPA emission standards. Note that, for purposes of this paragraph (f)(4), a configuration is considered to meet EPA emission standards if it was previously certified or was otherwise shown to meet emission standards (see § 1068.265).

(5) The standard-setting part may apply further restrictions to situations involving installation of used engines to repower equipment. For example, see 40 CFR part 1037 for provisions that apply for glider vehicles.

* * * * *

■ 336. Section 1068.125 is amended by revising paragraph (b) introductory text to read as follows:

§ 1068.125 What happens if I violate the regulations?

* * * * *

(b) *Administrative penalties.* Instead of bringing a civil action, we may assess administrative penalties if the total is less than \$356,312 against you individually. This maximum penalty may be greater if the Administrator and the Attorney General jointly determine that a greater administrative penalty assessment is appropriate, or if the limit is adjusted under 40 CFR part 19. No court may review this determination. Before we assess an administrative penalty, you may ask for a hearing as described in subpart G of this part. The Administrator may compromise or remit, with or without conditions, any administrative penalty that may be imposed under this section.

* * * * *

Subpart C—Exemptions and Exclusions

■ 337. Section 1068.201 is amended by revising the section heading, introductory text, and paragraphs (a) and (c) to read as follows:

§ 1068.201 General exemption and exclusion provisions.

We may exempt new engines/equipment from some or all of the prohibited acts or requirements of this

part under provisions described in this subpart. We may exempt nonroad engines/equipment already placed in service in the United States from the prohibition in § 1068.101(b)(1) if the exemption for nonroad engines/equipment used solely for competition applies (see § 1068.235). In addition, see § 1068.1 and the standard-setting parts to determine if other engines/equipment are excluded from some or all of the regulations in this chapter.

(a) This subpart identifies which engines/equipment qualify for exemptions and what information we need. We may require more information.

* * * * *

(c) If you use an exemption under this subpart, we may require you to add a permanent or removable label to your exempted engines/equipment. You may ask us to modify these labeling requirements if it is appropriate for your engine/equipment.

* * * * *

■ 338. Section 1068.210 is amended by revising the section heading and paragraph (e) to read as follows:

§ 1068.210 Exempting test engines/equipment.

* * * * *

(e) If we approve your request for a testing exemption, we will send you a letter or a memorandum describing the basis and scope of the exemption. It will also include any necessary terms and conditions, which normally require you to do the following:

- (1) Stay within the scope of the exemption.
- (2) Create and maintain adequate records that we may inspect.
- (3) Add a permanent label to all engines/equipment exempted under this section, consistent with § 1068.45, with at least the following items:
 - (i) The label heading “EMISSION CONTROL INFORMATION”.
 - (ii) Your corporate name and trademark.
 - (iii) Engine displacement, family identification, and model year of the engine/equipment (as applicable), or whom to contact for further information.
 - (iv) The statement: “THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.210 OR 1068.215 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS.”

(4) Tell us when the test program is finished.

(5) Tell us the final disposition of the engines/equipment.

■ 339. Section 1068.215 is amended by revising the section heading and paragraphs (a) and (c)(3)(iv) to read as follows:

§ 1068.215 Exempting manufacturer-owned engines/equipment.

(a) You are eligible for this exemption for manufacturer-owned engines/equipment only if you are a certificate holder. Any engine for which you meet all applicable requirements under this section is exempt without request.

* * * * *

(c) * * *

(3) * * *

(iv) The statement: “THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.210 OR 1068.215 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS.”

■ 340. Section 1068.220 is revised to read as follows:

§ 1068.220 Exempting display engines/equipment.

(a) Anyone may request an exemption for display engines/equipment.

(b) Nonconforming display engines/equipment will be exempted if they are used only for displays in the interest of a business or the general public. This exemption does not apply to engines/equipment displayed for private use, private collections, or any other purpose we determine is inappropriate for a display exemption.

(c) You may operate the exempted engine/equipment, but only if we approve specific operation that is part of the display, or is necessary for the display (possibly including operation that is indirectly necessary for the display). We may consider any relevant factor in our approval process, including the extent of the operation, the overall emission impact, and whether the engine/equipment meets emission requirements of another country.

(d) You may sell or lease the exempted engine/equipment only with our advance approval.

(e) To use this exemption, you must add a permanent label to all engines/equipment exempted under this section, consistent with § 1068.45, with at least the following items:

- (1) The label heading “EMISSION CONTROL INFORMATION”.
- (2) Your corporate name and trademark.
- (3) Engine displacement, family identification, and model year of the engine/equipment (as applicable), or whom to contact for further information.

(4) The statement: “THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.220 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS.”

(f) We may set other conditions for approval of this exemption.

■ 341. Section 1068.225 is revised to read as follows:

§ 1068.225 Exempting engines/equipment for national security.

The standards and requirements of the standard-setting part and the prohibitions in § 1068.101(a)(1) and (b) do not apply to engines exempted under this section.

(a) An engine/equipment is exempt without a request if it will be owned by an agency of the Federal Government responsible for national defense and it meets at least one of the following criteria:

(1) An engine is automatically exempt in cases where the equipment in which it will be installed has armor, permanently attached weaponry, or other substantial features typical of military combat. Similarly, equipment subject to equipment-based standards is automatically exempt if it has any of these same features.

(2) In the case of marine vessels with compression-ignition engines, an engine is automatically exempt if the vessel in which it will be installed has specialized electronic warfare systems, unique stealth performance requirements, or unique combat maneuverability requirements.

(3) Gas turbine engines installed in marine vessels are automatically exempt.

(4) An engine/equipment is automatically exempt if it would need sulfur-sensitive technology to comply with emission standards, and it is intended to be used in areas outside the United States where ultra low-sulfur fuel is unavailable.

(b) For the circumstances described in paragraphs (a)(1) and (2) of this section, an engine/equipment is also exempt without a request if it will be used, but not owned, by an agency of the Federal Government responsible for national defense.

(c) Manufacturers may produce and ship engines/equipment under an automatic exemption as described in paragraph (a) or (b) of this section if they receive a written request for such engines/equipment from the appropriate federal agency.

(d) Manufacturers may request a national security exemption for engines/equipment not meeting the conditions of paragraphs (a) and (b) of this section as long as the request is endorsed by an agency of the Federal Government responsible for national defense. In your request, explain why you need the exemption.

(e) Add a permanent label to all engines/equipment exempted under this

section, consistent with § 1068.45, with at least the following items:

(1) The label heading “EMISSION CONTROL INFORMATION”.

(2) Your corporate name and trademark.

(3) Engine displacement, family identification, and model year of the engine/equipment (as applicable), or whom to contact for further information.

(4) The statement: “THIS [engine, equipment, vehicle, etc.] HAS AN EXEMPTION FOR NATIONAL SECURITY UNDER 40 CFR 1068.225.”

■ 342. Section 1068.230 is amended by revising the section heading and paragraphs (b) and (c) to read as follows:

§ 1068.230 Exempting engines/equipment for export.

* * * * *

(b) Engines/equipment exported to a country not covered by paragraph (a) of this section are exempt from the prohibited acts in this part without a request. If you produce exempt engines/equipment for export and any of them are sold or offered for sale to an ultimate purchaser in the United States, the exemption is automatically void for those engines/equipment, except as specified in § 1068.201(i). You may operate engines/equipment in the United States only as needed to prepare and deliver them for export.

(c) Except as specified in paragraph (d) of this section, label exempted engines/equipment (including shipping containers if the label on the engine/equipment will be obscured by the container) with a label showing that they are not certified for sale or use in the United States. This label may be permanent or removable. See § 1068.45 for provisions related to the use of removable labels and applying labels to containers without labeling individual engines/equipment. The label must include your corporate name and trademark and the following statement: “THIS [engine, equipment, vehicle, etc.] IS SOLELY FOR EXPORT AND IS THEREFORE EXEMPT UNDER 40 CFR 1068.230 FROM U.S. EMISSION STANDARDS AND RELATED REQUIREMENTS.”

* * * * *

■ 343. Section 1068.235 is revised to read as follows:

§ 1068.235 Exempting nonroad engines/equipment used solely for competition.

The following provisions apply for nonroad engines/equipment, but not for motor vehicles or for stationary applications:

(a) New nonroad engines/equipment you produce that are used solely for competition are excluded from emission

standards. We may exempt (rather than exclude) new nonroad engines/equipment you produce that you intend to be used solely for competition, where we determine that such engines/equipment are unlikely to be used contrary to your intent. See the standard-setting parts for specific provisions where applicable. Note that the definitions in the standard-setting part may deem uncertified engines/equipment to be new upon importation.

(b) If you modify any nonroad engines/equipment after they have been placed into service in the United States so they will be used solely for competition, they are exempt without request. This exemption applies only to the prohibitions in § 1068.101(b)(1) and (2) and are valid only as long as the engine/equipment is used solely for competition. You may not use the provisions of this paragraph (b) to circumvent the requirements that apply to the sale of new competition engines under the standard-setting part.

(c) If you modify any nonroad engines/equipment under paragraph (b) of this section, you must destroy the original emission labels. If you loan, lease, sell, or give any of these engines/equipment to someone else, you must tell the new owner (or operator, if applicable) in writing that they may be used only for competition.

■ 344. Section 1068.240 is amended by revising the section heading and paragraphs (b)(3), (c)(1), (c)(3), (d)(2)(ii), and (e) introductory text to read as follows:

§ 1068.240 Exempting new replacement engines.

* * * * *

(b) * * *

(3) An old engine block replaced by a new engine exempted under this paragraph (b) may be reintroduced into U.S. commerce as part of an engine that meets either the current standards for new engines, the provisions for new replacement engines in this section, or another valid exemption. Otherwise, you must destroy the old engine block (or confirm that it has been destroyed), or export the engine block without its emission label.

* * * * *

(c) * * *

(1) You may produce a limited number of replacement engines under this paragraph (c) representing 0.5 percent of your annual production volumes for each category and subcategory of engines identified in Table 1 to this section (1.0 percent through 2013). Calculate this number by multiplying your annual U.S.-directed production volume by 0.005 (or 0.01

through 2013) and rounding to the nearest whole number. Determine the appropriate production volume by identifying the highest total annual U.S.-directed production volume of engines from the previous three model years for all your certified engines from each category or subcategory identified in Table 1 to this section, as applicable. In unusual circumstances, you may ask us to base your production limits on U.S.-directed production volume for a model year more than three years prior. You may include stationary engines and exempted engines as part of your U.S.-directed production volume. Include U.S.-directed engines produced by any affiliated companies and those from any other companies you license to produce engines for you.

* * * * *

(3) Send the Designated Compliance Officer a report by September 30 of the year following any year in which you produced exempted replacement engines under this paragraph (c). In your report include the total number of replacement engines you produce under this paragraph (c) for each category or subcategory, as appropriate, and the corresponding total production volumes determined under paragraph (c)(1) of this section. If you send us a report under this paragraph (c)(3), you must also include the total number of replacement engines you produced under paragraphs (b), (d), and (e) of this section (including any replacement marine engines subject to reporting under 40 CFR 1042.615). Count exempt engines as tracked under paragraph (b) of this section only if you meet all the requirements and conditions that apply under paragraph (b) of this section by the due date for the annual report. You may include the information required under this paragraph (c)(3) in production reports required under the standard-setting part.

* * * * *

(d) * * *
(2) * * *

(ii) If you do not qualify for using a removable label in paragraph (d)(2)(i) of this section, you must add a permanent label in a readily visible location, though it may be obscured after installation in a piece of equipment. Include on the permanent label your corporate name and trademark, the engine's part number (or other identifying information), and the statement: "THIS REPLACEMENT ENGINE IS EXEMPT UNDER 40 CFR 1068.240. THIS ENGINE MAY NOT BE INSTALLED IN EQUIPMENT THAT IS MORE THAN 40 YEARS OLD AT THE TIME OF INSTALLATION." If there is

not enough space for this statement, you may alternatively add: "REPLACEMENT" or "SERVICE ENGINE." For purposes of this paragraph (d)(2), engine part numbers permanently stamped or engraved on the engine are considered to be included on the label.

(e) *Partially complete current-tier replacement engines.* The provisions of paragraph (d) of this section apply for engines you produce from a current line of certified engines or vehicles if you ship them as partially complete engines for replacement purposes. This applies for engine-based and equipment-based standards as follows:

* * * * *

■ 345. Section 1068.245 is amended by revising the section heading and paragraph (g)(4) to read as follows:

§ 1068.245 Temporary provisions addressing hardship due to unusual circumstances.

* * * * *

(g) * * *

(4) A statement describing the engine's status as an exempted engine:

(i) If the engine/equipment does not meet any emission standards, add the following statement: "THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.245 FROM EMISSION STANDARDS AND RELATED REQUIREMENTS."

(ii) If the engines/equipment meet alternate emission standards as a condition of an exemption under this section, we may specify a different statement to identify the alternate emission standards.

■ 346. Section 1068.250 is amended by revising the section heading and paragraphs (c) introductory text and (k)(4) and removing and reserving paragraph (h).

The revisions read as follows:

§ 1068.250 Extending compliance deadlines for small businesses under hardship.

* * * * *

(c) Send the Designated Compliance Officer a written request for an extension as soon as possible before you are in violation. In your request, show that all the following conditions and requirements apply:

* * * * *

(k) * * *

(4) A statement describing the engine's status as an exempted engine:

(i) If the engine/equipment does not meet any emission standards, add the following statement: "THIS [engine, equipment, vehicle, etc.] IS EXEMPT UNDER 40 CFR 1068.250 FROM

EMISSION STANDARDS AND RELATED REQUIREMENTS."

(ii) If the engine/equipment meets alternate emission standards as a condition of an exemption under this section, we may specify a different statement to identify the alternate emission standards.

■ 347. Section 1068.255 is amended by revising the section heading and paragraph (a) introductory text to read as follows:

§ 1068.255 Exempting engines and fuel-system components for hardship for equipment manufacturers and secondary engine manufacturers.

* * * * *

(a) *Equipment exemption.* As an equipment manufacturer, you may ask for approval to produce exempted equipment for up to 12 months. We will generally limit this to a single interval up to 12 months in the first year that new or revised emission standards apply. Exemptions under this section are not limited to small businesses. Send the Designated Compliance Officer a written request for an exemption before you are in violation. In your request, you must show you are not at fault for the impending violation and that you would face serious economic hardship if we do not grant the exemption. This exemption is not available under this paragraph (a) if you manufacture the engine or fuel-system components you need for your own equipment, or if complying engines or fuel-system components are available from other manufacturers that could be used in your equipment, unless we allow it elsewhere in this chapter. We may impose other conditions, including provisions to use products meeting less stringent emission standards or to recover the lost environmental benefit. In determining whether to grant the exemptions, we will consider all relevant factors, including the following:

* * * * *

■ 348. Section 1068.260 is revised to read as follows:

§ 1068.260 General provisions for selling or shipping engines that are not yet in their certified configuration.

Except as specified in paragraph (e) of this section, all new engines in the United States are presumed to be subject to the prohibitions of § 1068.101, which generally require that all new engines be in a certified configuration before being sold, offered for sale, or introduced or delivered into commerce in the United States or imported into the United States. All emission-related components generally need to be installed on an

engine for such an engine to be in its certified configuration. This section specifies clarifications and exemptions related to these requirements for engines. Except for paragraph (c) of this section, the provisions of this section generally apply for engine-based standards but not for equipment-based exhaust emission standards.

(a) The provisions of this paragraph (a) apply for emission-related components that cannot practically be assembled before shipment because they depend on equipment design parameters.

(1) You do not need an exemption to ship an engine that does not include installation or assembly of certain emission-related components if those components are shipped along with the engine. For example, you may generally ship aftertreatment devices along with engines rather than installing them on the engine before shipment. We may require you to describe how you plan to use this provision.

(2) You may ask us at the time of certification for an exemption to allow you to ship your engines without emission-related components. If we allow this, we may specify conditions that we determine are needed to ensure that shipping the engine without such components will not result in the engine being operated outside of its certified configuration. You must identify unshipped parts by specific part numbers if they cannot be properly characterized by performance specification. For example, electronic control units, turbochargers, and EGR coolers must generally be identified by part number. Parts that we believe can be properly characterized by performance specification include air filters, noncatalyzed mufflers, and charge air coolers. See paragraph (d) of this section for additional provisions that apply in certain circumstances.

(b) You do not need an exemption to ship engines without specific components if they are not emission-related components identified in Appendix I of this part. For example, you may generally ship engines without the following parts:

(1) Radiators needed to cool the engine.

(2) Exhaust piping between the engine and an aftertreatment device, between two aftertreatment devices, or downstream of the last aftertreatment device.

(c) If you are a certificate holder, partially complete engines/equipment shipped between two of your facilities are exempt, subject to the provisions of this paragraph (c), as long as you maintain ownership and control of the

engines/equipment until they reach their destination. We may also allow this where you do not maintain actual ownership and control of the engines/equipment (such as hiring a shipping company to transport the engines) but only if you demonstrate that the engines/equipment will be transported only according to your specifications. See § 1068.261(b) for the provisions that apply instead of this paragraph (c) for the special case of integrated manufacturers using the delegated-assembly exemption. Notify us of your intent to use this exemption in your application for certification, if applicable. Your exemption is effective when we grant your certificate. You may alternatively request an exemption in a separate submission; for example, this would be necessary if you will not be the certificate holder for the engines in question. We may require you to take specific steps to ensure that such engines/equipment are in a certified configuration before reaching the ultimate purchaser. Note that since this is a temporary exemption, it does not allow you to sell or otherwise distribute to ultimate purchasers an engine/equipment in an uncertified configuration with respect to exhaust emissions. Note also that the exempted engine/equipment remains new and subject to emission standards (see definition of “exempted” in § 1068.30) until its title is transferred to the ultimate purchaser or it otherwise ceases to be new.

(d) See § 1068.261 for delegated-assembly provisions in which certificate-holding manufacturers ship engines that are not yet equipped with certain emission-related components. See § 1068.262 for provisions related to manufacturers shipping partially complete engines for which a secondary engine manufacturer holds the certificate of conformity.

(e) Engines used in hobby vehicles are not presumed to be engines subject to the prohibitions of § 1068.101. Hobby vehicles are reduced-scale models of vehicles that are not capable of transporting a person. Some gas turbine engines are subject to the prohibitions of § 1068.101, but we do not presume that all gas turbine engines are subject to these prohibitions. Other engines that do not have a valid certificate of conformity or exemption when sold, offered for sale, or introduced or delivered into commerce in the United States or imported into the United States are presumed to be engines subject to the prohibitions of § 1068.101 unless we determine that such engines are excluded from the prohibitions of § 1068.101.

(f) While we presume that new non-hobby engines are subject to the prohibitions of § 1068.101, we may determine that a specific engine is not subject to these prohibitions based on information you provide or other information that is available to us. For example, the provisions of this part 1068 and the standard-setting parts provide for exemptions in certain circumstances. Also, some engines may be subject to separate prohibitions under subchapter C instead of the prohibitions of § 1068.101.

■ 349. Section 1068.261 is amended by revising the section heading and paragraph (a) to read as follows:

§ 1068.261 Delegated assembly and other provisions related to engines not yet in the certified configuration.

* * * * *

(a) Shipping an engine separately from an aftertreatment component that you have specified as part of its certified configuration will not be a violation of the prohibitions in § 1068.101(a)(1) subject to the provisions in this section. We may also require that you apply some or all of the provisions of this section for other components if we determine it is necessary to ensure that shipping the engine without such components will not result in the engine being operated outside of its certified configuration. In making this determination, we will consider the importance of the component for controlling emissions and the likelihood that equipment manufacturers will have an incentive to disregard your emission-related installation instructions based on any relevant factors, such as the cost of the component and any real or perceived expectation of a negative impact on engine or equipment performance.

* * * * *

■ 350. Section 1068.262 is revised to read as follows:

§ 1068.262 Shipment of engines to secondary engine manufacturers.

This section specifies how manufacturers may introduce into U.S. commerce partially complete engines that have an exemption or a certificate of conformity held by a secondary engine manufacturer and are not yet in a certified configuration. See the standard-setting part to determine whether and how the provisions of this section apply. (Note: See § 1068.261 for provisions related to manufacturers introducing into U.S. commerce partially complete engines for which they hold the certificate of conformity.) This exemption is temporary as

described in paragraph (g) of this section.

(a) The provisions of this section generally apply where the secondary engine manufacturer has substantial control over the design and assembly of emission controls. In unusual circumstances we may allow other secondary engine manufacturers to use these provisions. In determining whether a manufacturer has substantial control over the design and assembly of emission controls, we would consider the degree to which the secondary engine manufacturer would be able to ensure that the engine will conform to the regulations in its final configuration. Such secondary engine manufacturers may finish assembly of partially complete engines in the following cases:

(1) You obtain an engine that is not fully assembled with the intent to manufacture a complete engine.

(2) You obtain an engine with the intent to modify it before it reaches the ultimate purchaser.

(3) You obtain an engine with the intent to install it in equipment that will be subject to equipment-based standards.

(b) Manufacturers may introduce into U.S. commerce partially complete engines as described in this section if they have a written request for such engines from a secondary engine manufacturer that has certified the engine and will finish the engine assembly. The written request must include a statement that the secondary engine manufacturer has a certificate of conformity for the engine and identify a valid engine family name associated with each engine model ordered (or the basis for an exemption if applicable, as specified in paragraph (e) of this section). The original engine manufacturer must apply a removable label meeting the requirements of § 1068.45 that identifies the corporate name of the original manufacturer and states that the engine is exempt under the provisions of § 1068.262. The name of the certifying manufacturer must also be on the label or, alternatively, on the bill of lading that accompanies the engines during shipment. The original engine manufacturer may not apply a permanent emission control information label identifying the engine's eventual status as a certified engine.

(c) If you are the secondary engine manufacturer and you will hold the certificate, you must include the following information in your application for certification:

(1) Identify the original engine manufacturer of the partially complete engine or of the complete engine you will modify.

(2) Describe briefly how and where final assembly will be completed. Specify how you have the ability to ensure that the engines will conform to the regulations in their final configuration. (Note: Paragraph (a) of this section prohibits using the provisions of this section unless you have substantial control over the design and assembly of emission controls.)

(3) State unconditionally that you will not distribute the engines without conforming to all applicable regulations.

(d) If you are a secondary engine manufacturer and you are already a certificate holder for other families, you may receive shipment of partially complete engines after you apply for a certificate of conformity but before the certificate's effective date. In this case, all the provisions of § 1068.103(c)(1) through (3) apply. This exemption allows the original manufacturer to ship engines after you have applied for a certificate of conformity. Manufacturers may introduce into U.S. commerce partially complete engines as described in this paragraph (d) if they have a written request for such engines from a secondary engine manufacturer stating that the application for certification has been submitted (instead of the information we specify in paragraph (b) of this section). We may set additional conditions under this paragraph (d) to prevent circumvention of regulatory requirements. Consistent with § 1068.103(c), we may also revoke an exemption under this paragraph (d) if we have reason to believe that the application for certification will not be approved or that the engines will otherwise not reach a certified configuration before reaching the ultimate purchaser. This may require that you export the engines.

(e) The provisions of this section also apply for shipping partially complete engines if the engine is covered by a valid exemption and there is no valid engine family name that could be used to represent the engine model. Unless we approve otherwise in advance, you may do this only when shipping engines to secondary engine manufacturers that are certificate holders. In this case, the secondary engine manufacturer must identify the regulatory cite identifying the applicable exemption instead of a valid engine family name when ordering engines from the original engine manufacturer.

(f) If secondary engine manufacturers determine after receiving an engine under this section that the engine will not be covered by a certificate or exemption as planned, they may ask us to allow for shipment of the engines back to the original engine manufacturer

or to another secondary engine manufacturer. This might occur in the case of an incorrect shipment or excess inventory. We may modify the provisions of this section as appropriate to address these cases.

(g) Both original and secondary engine manufacturers must keep the records described in this section for at least five years, including the written request for engines and the bill of lading for each shipment (if applicable). The written request is deemed to be a submission to EPA and is thus subject to the reporting requirements of § 1068.101(a)(2).

(h) These provisions are intended only to allow secondary engine manufacturers to obtain or transport engines in the specific circumstances identified in this section so any exemption under this section expires when the engine reaches the point of final assembly identified in paragraph (c)(2) of this section.

(i) For purposes of this section, an allowance to introduce partially complete engines into U.S. commerce includes a conditional allowance to sell, introduce, or deliver such engines into commerce in the United States or import them into the United States. It does not include a general allowance to offer such partially complete engines for sale because this exemption is intended to apply only for cases in which the certificate holder already has an arrangement to purchase the engines from the original engine manufacturer. This exemption does not allow the original engine manufacturer to subsequently offer the engines for sale to a different manufacturer who will hold the certificate unless that second manufacturer has also complied with the requirements of this part. The exemption does not apply for any individual engines that are not labeled as specified in this section or which are shipped to someone who is not a certificate holder.

(j) We may suspend, revoke, or void an exemption under this section, as follows:

(1) We may suspend or revoke your exemption if you fail to meet the requirements of this section. We may suspend or revoke an exemption related to a specific secondary engine manufacturer if that manufacturer sells engines that are in not in a certified configuration in violation of the regulations. We may disallow this exemption for future shipments to the affected secondary engine manufacturer or set additional conditions to ensure that engines will be assembled in the certified configuration.

(2) We may void an exemption for all the affected engines if you intentionally submit false or incomplete information or fail to keep and provide to EPA the records required by this section.

(3) The exemption is void for an engine that is shipped to a company that is not a certificate holder or for an engine that is shipped to a secondary engine manufacturer that is not in compliance with the requirements of this section.

(4) The secondary engine manufacturer may be liable for causing a prohibited act if voiding the exemption is due to its own actions.

(k) No exemption is needed to import equipment that does not include an engine. No exemption from exhaust emission standards is available under this section for equipment subject to equipment-based standards if the engine has been installed.

■ 351. Section 1068.265 is amended by revising the section heading to read as follows:

§ 1068.265 Provisions for engines/equipment conditionally exempted from certification.

* * * * *

Subpart D—Imports

■ 352. Section 1068.301 is amended by revising the section heading and paragraphs (b) and (d) and adding paragraph (e) to read as follows:

§ 1068.301 General provisions for importing engines/equipment.

* * * * *

(b) In general, engines/equipment that you import must be covered by a certificate of conformity unless they were built before emission standards started to apply. This subpart describes the limited cases where we allow importation of exempt or excluded engines/equipment. If an engine has an exemption from exhaust emission standards, this allows you to import the equipment under the same exemption.

* * * * *

(d) Complete the appropriate EPA declaration before importing any engines or equipment. These forms may be submitted and stored electronically and are available on the Internet at <http://www.epa.gov/OTAQ/imports/> or by phone at 734-214-4100. Importers must keep these records for five years and make them available promptly upon request.

(e) The standard-setting part may define uncertified engines/equipment to be “new” upon importation, whether or not they have already been placed into service. This may affect how the

provisions of this subpart apply for your engines/equipment. (See the definition of “new” and other relevant terms in the standard-setting part.)

■ 353. Section 1068.305 is amended by revising paragraphs (b)(1) and (2) to read as follows:

§ 1068.305 How do I get an exemption or exclusion for imported engines/equipment?

* * * * *

(b) * * *

(1) Give your name, address, and telephone number.

(2) Give the engine/equipment owner's name, address, and telephone number.

* * * * *

■ 354. Section 1068.310 is amended by revising the section heading and paragraph (a) to read as follows:

§ 1068.310 Exclusions for imported engines/equipment.

* * * * *

(a) *Nonroad engines/equipment used solely for competition.* Nonroad engines/equipment that you demonstrate will be used solely for competition are excluded from the restrictions on imports in § 1068.301(b), but only if they are properly labeled. See the standard-setting part for provisions related to this demonstration that may apply. Section 1068.101(b)(4) prohibits anyone from using these excluded engines/equipment for purposes other than competition. We may waive the labeling requirement or allow a removable label for engines/equipment that are being temporarily imported for one or more specific competition events.

* * * * *

■ 355. Section 1068.315 is amended by revising the section heading and paragraph (i) to read as follows:

§ 1068.315 Permanent exemptions for imported engines/equipment.

* * * * *

(i) *Ancient engine/equipment exemption.* If you are not the original engine/equipment manufacturer, you may import nonconforming engines/equipment that are subject to a standard-setting part and were first manufactured at least 21 years earlier, as long as they are still substantially in their original configurations.

■ 356. Section 1068.325 is amended by revising the section heading, introductory text, and paragraphs (a), (c), (d), and (j)(5) to read as follows:

§ 1068.325 Temporary exemptions for imported engines/equipment.

You may import engines/equipment under certain temporary exemptions,

subject to the conditions in this section. We may ask U.S. Customs and Border Protection to require a specific bond amount to make sure you comply with the requirements of this subpart. You may not sell or lease one of these engines/equipment while it is in the United States except as specified in this section or § 1068.201(i). You must eventually export the engine/equipment as we describe in this section unless it conforms to a certificate of conformity or it qualifies for one of the permanent exemptions in § 1068.315 or the standard-setting part.

(a) *Exemption for repairs or alterations.* You may temporarily import nonconforming engines/equipment under bond solely for repair or alteration, subject to our advance approval as described in paragraph (j) of this section. You may operate the engine/equipment in the United States only as necessary to repair it, alter it, or ship it to or from the service location. Export the engine/equipment directly after servicing is complete, or confirm that it has been destroyed.

* * * * *

(c) *Display exemption.* You may temporarily import nonconforming engines/equipment under bond for display if you follow the requirements of § 1068.220, subject to our advance approval as described in paragraph (j) of this section. This exemption expires one year after you import the engine/equipment, unless we approve your request for an extension. The engine/equipment must be exported (or destroyed) by the time the exemption expires or directly after the display concludes, whichever comes first.

(d) *Export exemption.* You may temporarily import nonconforming engines/equipment to export them, as described in § 1068.230. Label the engine/equipment as described in § 1068.230. You may sell or lease the engines/equipment for operation outside the United States consistent with the provisions of § 1068.230.

* * * * *

(j) * * *

(5) Acknowledge that EPA enforcement officers may conduct inspections or testing as allowed under the Clean Air Act.

* * * * *

■ 357. Section 1068.335 is amended by revising the section heading to read as follows:

§ 1068.335 Penalties for violations.

* * * * *

■ 358. Section 1068.360 is amended by revising the section heading and paragraph (b) to read as follows:

§ 1068.360 Restrictions for assigning a model year to imported engines and equipment.

* * * * *

(b) This paragraph (b) applies for the importation of engines and equipment that have not been placed into service, where the importation occurs in any calendar year that is more than one year after the named model year of the engine or equipment when emission control requirements applying to current engines are different than for engines or equipment in the named model year, unless they are imported under special provisions for Independent Commercial Importers as allowed under the standard-setting part. Regardless of what other provisions of this subchapter U specify for the model year of the engine or equipment, such engines and equipment are deemed to have an applicable model year no more than one year earlier than the calendar year in which they are imported. For example, a new engine identified as a 2007 model-year product that is imported on January 31, 2010 will be treated as a 2009 model-year engine; the same engine will be treated as a 2010 model-year engine if it is imported any time in calendar year 2011.

* * * * *

Subpart E—Selective Enforcement Auditing

■ 359. Section 1068.401 is revised to read as follows:

§ 1068.401 What is a selective enforcement audit?

(a) We may conduct or require you as a certificate holder to conduct emission tests on production engines/equipment in a selective enforcement audit. This requirement is independent of any requirement for you to routinely test production-line engines/equipment. Where there are multiple entities meeting the definition of manufacturer, we may require manufacturers other than the certificate holder to conduct or participate in the audit as necessary. For products subject to equipment-based standards, but tested using engine-based test procedures, this subpart applies to the engines and/or the equipment, as applicable. Otherwise this subpart applies to engines for products subject to engine-based standards and to equipment for products subject to equipment-based standards.

(b) If we send you a signed test order, you must follow its directions and the provisions of this subpart. We may tell you where to test the engines/equipment. This may be where you produce the engines/equipment or any

other emission testing facility. You are responsible for all testing costs whether the testing is conducted at your facility or another facility.

(c) If we select one or more of your families for a selective enforcement audit, we will send the test order to the person who signed the application for certification or we will deliver it in person.

(d) If we do not select a testing facility, notify the Designated Compliance Officer within one working day of receiving the test order where you will test your engines/equipment.

(e) You must do everything we require in the audit without delay. We may suspend or revoke your certificate of conformity for the affected engine families if you do not fulfill your obligations under this subpart.

■ 360. Section 1068.405 is amended by revising paragraph (a)(1) to read as follows:

§ 1068.405 What is in a test order?

(a) * * *

(1) The family we have identified for testing. We may also specify individual configurations.

* * * * *

■ 361. Section 1068.415 is amended by revising paragraphs (c) and (d) to read as follows:

§ 1068.415 How do I test my engines/equipment?

* * * * *

(c) Test at least two engines/equipment in each 24-hour period (including void tests). However, for engines with maximum engine power above 560 kW, you may test one engine per 24-hour period. If you request and justify it, we may approve a lower testing rate.

(d) For exhaust emissions, accumulate service on test engines/equipment at a minimum rate of 6 hours per engine or piece of equipment during each 24-hour period; however, service accumulation to stabilize an engine's emission levels may not take longer than eight days. The first 24-hour period for service accumulation begins when you finish preparing an engine or piece of equipment for testing. The minimum service accumulation rate does not apply on weekends or holidays. We may approve a longer stabilization period or a lower service accumulation rate if you request and justify it. We may require you to accumulate hours more rapidly than the minimum rate, as appropriate. Plan your service accumulation to allow testing at the rate specified in paragraph (c) of this section. Select operation for accumulating operating hours on your

test engines/equipment to represent normal in-use operation for the family.

* * * * *

■ 362. Section 1068.420 is amended by revising paragraphs (b) and (e) to read as follows:

§ 1068.420 How do I know when my engine family fails an SEA?

* * * * *

(b) Continue testing engines/equipment until you reach a pass decision for all pollutants or a fail decision for one pollutant, as described in paragraph (c) of this section.

* * * * *

(e) If you reach a pass decision for one pollutant, but need to continue testing for another pollutant, we will not use these later test results for the pollutant with the pass decision as part of the SEA.

* * * * *

■ 363. Section 1068.425 is amended by revising paragraph (b) to read as follows:

§ 1068.425 What happens if one of my production-line engines/equipment exceeds the emission standards?

* * * * *

(b) You may ask for a hearing relative to the suspended certificate of conformity for the failing engine/equipment as specified in subpart G of this part.

■ 364. Section 1068.430 is amended by revising paragraph (c) to read as follows:

§ 1068.430 What happens if a family fails an SEA?

* * * * *

(c) You may ask for a hearing as described in subpart G of this part up to 15 days after we suspend the certificate for a family. If we agree that we used erroneous information in deciding to suspend the certificate before a hearing is held, we will reinstate the certificate.

■ 365. Section 1068.450 is amended by revising paragraph (b) to read as follows:

§ 1068.450 What records must I send to EPA?

* * * * *

(b) We may ask you to add information to your written report, so we can determine whether your new engines/equipment conform to the requirements of this subpart.

* * * * *

Subpart F—Reporting Defects and Recalling Engines/Equipment

■ 366. Section 1068.501 is amended by revising paragraphs (a)(1)(iv), (a)(8), and (b)(1)(iii) to read as follows:

§ 1068.501 How do I report emission-related defects?

* * * * *

(a) * * *

(1) * * *

(iv) Any other component whose failure would commonly increase emissions of any regulated pollutant without significantly degrading engine/equipment performance.

* * * * *

(8) Send all reports required by this section to the Designated Compliance Officer.

* * * * *

(b) * * *

(1) * * *

(iii) You receive any other information for which good engineering judgment would indicate the component or system may be defective, such as information from dealers, field-service personnel, equipment manufacturers, hotline complaints, in-use testing, or engine diagnostic systems.

* * * * *

■ 367. Section 1068.505 is amended by revising paragraphs (a), (c), and (g) to read as follows:

§ 1068.505 How does the recall program work?

(a) If we make a determination that a substantial number of properly maintained and used engines/equipment within a given class or category do not conform to the regulations of this chapter during their useful life, you must submit a plan to remedy the nonconformity of your engines/equipment. We will notify you of our determination in writing. Our notice will identify the class or category of engines/equipment affected and describe how we reached our conclusion. If this happens, you must meet the requirements and follow the instructions in this subpart. You must remedy at your expense all engines/equipment that experienced the nonconformity during the useful life in spite of being properly maintained and used, as described in § 1068.510(a)(7), regardless of their age or extent of service accumulation at the time of repair. You may not transfer this expense to a dealer (or equipment manufacturer for engine-based standards) through a franchise or other agreement.

* * * * *

(c) Unless we withdraw the determination of noncompliance, you must respond to it by sending a remedial plan to the Designated Compliance Officer. We will designate a date by which you must send us the

remedial plan; the designated date will be no sooner than 45 days after we notify you, and no sooner than 30 days after a hearing.

* * * * *

(g) For purposes of recall, “owner” means someone who owns an engine or piece of equipment affected by a remedial plan.

■ 368. Section 1068.510 is amended by revising paragraphs (a)(6), (b), and (h) to read as follows:

§ 1068.510 How do I prepare and apply my remedial plan?

(a) * * *

(6) How you will notify owners; include a copy of any notification letters.

* * * * *

(b) We may require you to add information if it is needed to evaluate your remedial plan.

* * * * *

(h) Begin notifying owners within 15 days after we approve your remedial plan. If we hold a hearing, but do not change our position about the noncompliance, you must begin notifying owners within 60 days after we complete the hearing unless we specify a later deadline.

■ 369. Section 1068.515 is amended by revising paragraphs (a) and (c) to read as follows:

§ 1068.515 How do I mark or label repaired engines/equipment?

(a) Attach a label to engines/equipment you repair under the remedial plan. At your discretion, you may label or mark engines/equipment you inspect but do not repair. Designate the specific recall campaign on the label.

* * * * *

(c) Identify the facility where you repaired or inspected the engine/equipment on the label, or keep records of this information for each vehicle and give it to us if we ask for it.

* * * * *

■ 370. Section 1068.520 is amended by revising paragraph (b) to read as follows:

§ 1068.520 How do I notify affected owners?

* * * * *

(b) We may require you to add information to your notice or to send more notices if we determine this is reasonable and necessary to ensure an effective recall.

* * * * *

■ 371. Section 1068.530 is amended by revising the introductory text to read as follows:

§ 1068.530 What records must I keep?

We may review your records at any time so it is important that you keep required information readily available. Keep records associated with your recall campaign for five years after you send the last report we require under § 1068.525(b). Organize and maintain your records as described in this section.

* * * * *

■ 372. Subpart G is revised to read as follows:

Subpart G—Hearings

Sec.

1068.601 Overview.

1068.610 Request for hearing—suspending, revoking, or voiding a certificate of conformity.

1068.615 Request for hearing—denied application for certification, automatically suspended certificate, and determinations related to certification.

1068.620 Request for hearing—recall.

1068.625 Request for hearing—nonconformance penalties.

1068.650 Procedures for informal hearings.

Subpart G—Hearings**§ 1068.601 Overview.**

The regulations of this chapter involve numerous provisions that may result in EPA making a decision or judgment that you may consider adverse to your interests and that either limits your business activities or requires you to pay penalties. As specified in the regulations in this chapter, this might involve an opportunity for an informal hearing or a formal hearing that follows specific procedures and is directed by a Presiding Officer. The regulations in this chapter generally specify when we would hold a hearing. In limited circumstances, we may grant a request for a hearing related to adverse decisions regarding regulatory provisions for which we do not specifically describe the possibility of asking for a hearing.

(a) If you request a hearing regarding our decision to assess administrative penalties under § 1068.125, we will hold a formal hearing according to the provisions of 40 CFR 22.1 through 22.32 and 22.34.

(b) For other issues where the regulation allows for a hearing in response to an adverse decision, you may request an informal hearing as described in § 1068.650. Sections 1068.610 through 1068.625 describe when and how to request an informal hearing under various circumstances.

(c) The time limits we specify are calendar days and include weekends and holidays, except that a deadline falling on a Saturday, Sunday, or a

federal holiday is understood to move to the next business day. Your filing will be considered timely based on the following criteria relative to the specified deadline:

(1) The postmarked date for items sent by U.S. mail must be on or before the specified date.

(2) The ship date for items sent from any location within the United States by commercial carriers must be on or before the specified date.

(3) Items sent by mail or courier from outside the United States must be received by the specified date.

(4) The time and date stamp on an email message must be at or before 5:00 p.m. on the specified date (in either the source or destination time zone).

(5) The time and date stamp on faxed pages must be at or before 5:00 p.m. on the specified date (in either the source or destination time zone).

(6) Hand-delivered items must be received by the appropriate personnel by 3:00 p.m. on the specified date.

(d) See the standard-setting part for additional information. If the standard-setting part specifies any provisions that are contrary to those described in this subpart, the provisions of the standard-setting part apply instead of those described in this subpart.

§ 1068.610 Request for hearing—suspending, revoking, or voiding a certificate of conformity.

(a) You may request an informal hearing as described in § 1068.650 if you disagree with our decision to suspend, revoke, or void a certificate of conformity.

(b) If you request a hearing regarding the outcome of a testing regimen with established evaluation criteria, such as selective enforcement audits or routine production-line testing, we will hold a hearing limited to the following issues that are relevant to your circumstances:

(1) Whether tests were conducted in accordance with applicable regulations.

(2) Whether test equipment was properly calibrated and functioning.

(3) Whether specified sampling procedures were followed to select engines/equipment for testing.

(4) Whether there is a basis for determining that the problems identified do not apply for engines/equipment produced at plants other than the one from which engines/equipment were selected for testing.

(c) You must send your hearing request in writing to the Designated Compliance Officer no later than 30 days after we notify you of our decision to suspend, revoke, or void your certificate, or by some later deadline we specify. If the deadline passes, we may

nevertheless grant you a hearing at our discretion.

(d) Your hearing request must include the following information:

(1) Identify the classes or categories of engines/equipment that will be the subject of the hearing.

(2) State briefly which issues you will raise at the hearing for each affected class or category of engines/equipment.

(3) Specify why you believe the hearing will conclude in your favor for each of the issues you will raise.

(4) Summarize the evidence supporting your position on each of the issues you will raise and include any supporting data.

(e) We will approve your request for an informal hearing if we find that your request raises a substantial factual issue in the decision we made that, if addressed differently, could alter the outcome of that decision.

§ 1068.615 Request for hearing—denied application for certification, automatically suspended certificate, and determinations related to certification.

(a) You may request an informal hearing as described in § 1068.650 if we deny your application for a certificate of conformity, if your certificate of conformity is automatically suspended under the regulations, or if you disagree with determinations we make as part of the certification process. For example, you might disagree with our determinations regarding adjustable parameters under § 1068.50 or regarding your good engineering judgment under § 1068.5.

(b) You must send your hearing request in writing to the Designated Compliance Officer no later than 30 days after we notify you of our decision, or by some later deadline we specify. If the specified deadline passes, we may nevertheless grant you a hearing at our discretion.

(c) Your hearing request must include the information specified in § 1068.610(d).

(d) We will approve your request for an informal hearing if we find that your request raises a substantial factual issue in the decision we made that, if addressed differently, could alter the outcome of that decision.

§ 1068.620 Request for hearing—recall.

(a) You may request an informal hearing as described in § 1068.650 if you disagree with our decision to order a recall.

(b) You must send your hearing request in writing to the Designated Compliance Officer no later than 45 days after we notify you of our decision, or by some later deadline we specify. If

the specified deadline passes, we may nevertheless grant you a hearing at our discretion.

(c) Your hearing request must include the information specified in § 1068.610(d).

(d) We will approve your request for an informal hearing if we find that your request raises a substantial factual issue in the decision we made that, if addressed differently, could alter the outcome of that decision.

§ 1068.625 Request for hearing—nonconformance penalties.

(a) You may request an informal hearing as described in § 1068.650 if you disagree with our determination of compliance level or penalty calculation or both. The hearing will address only whether the compliance level or penalty was determined in accordance with the regulations.

(b) Send a request for a hearing in writing to the Designated Compliance Officer within the following time frame, as applicable:

(1) No later than 15 days after we notify you that we have approved a nonconformance penalty under this subpart if the compliance level is in the allowable range of nonconformity.

(2) No later than 15 days after completion of the Production Compliance Audit if the compliance level exceeds the upper limit.

(3) No later than 15 days after we notify you of an adverse decision for all other cases.

(c) If you miss the specified deadline in paragraph (b) of this section, we may nevertheless grant you a hearing at our discretion.

(d) Your hearing request must include the information specified in § 1068.610(d).

(e) We will approve your request for an informal hearing if we find that your request raises a substantial factual issue in the decision we made that, if addressed differently, could alter the outcome of that decision.

§ 1068.650 Procedures for informal hearings.

(a) The following provisions apply for arranging the hearing:

(1) After granting your request for an informal hearing, we will designate a Presiding Officer for the hearing.

(2) The Presiding Officer will select the time and place for the hearing. The hearing must be held as soon as practicable for all parties involved.

(3) The Presiding Officer may require that all argument and presentation of evidence be concluded by a certain date after commencement of the hearing.

(b) The Presiding Officer will establish a paper or electronic hearing

record, which may be made available for inspection. The hearing record includes, but is not limited to, the following materials:

(1) All documents relating to the application for certification, including the certificate of conformity itself, if applicable.

(2) Your request for a hearing and the accompanying supporting data.

(3) Correspondence and other data relevant to the hearing.

(4) The Presiding Officer's written decision regarding the subject of the hearing, together with any accompanying material.

(c) You may appear in person or you may be represented by counsel or by any other representative you designate.

(d) The Presiding Officer may arrange for a prehearing conference, either in response to a request from any party or at his or her own discretion. The Presiding Officer will select the time and place for the prehearing conference. The Presiding Officer will summarize the results of the conference and include the written summary as part of the record. The prehearing conference may involve consideration of the following items:

(1) Simplification of the issues.

(2) Stipulations, admissions of fact, and the introduction of documents.

(3) Limitation of the number of expert witnesses.

(4) Possibility of reaching an agreement to resolve any or all of the issues in dispute.

(5) Any other matters that may aid in expeditiously and successfully concluding the hearing.

(e) Hearings will be conducted as follows:

(1) The Presiding Officer will conduct informal hearings in an orderly and expeditious manner. The parties may offer oral or written evidence; however, the Presiding Officer may exclude evidence that is irrelevant, immaterial, or repetitious.

(2) Witnesses will not be required to testify under oath; however, the Presiding Officer must make clear that 18 U.S.C. 1001 specifies civil and criminal penalties for knowingly making false statements or representations or using false documents in any matter within the jurisdiction of EPA or any other department or agency of the United States.

(3) Any witness may be examined or cross-examined by the Presiding Officer, by you, or by any other parties.

(4) Written transcripts must be made for all hearings. Anyone may purchase copies of transcripts from the reporter.

(f) The Presiding Officer will make a final decision with written findings,

conclusions and supporting rationale on all the substantial factual issues presented in the record. The findings, conclusions, and written decision must be provided to the parties and made a part of the record.

■ 373. Appendix I to part 1068 is amended by revising paragraph IV to read as follows:

Appendix I to Part 1068—Emission-Related Components

* * * * *

IV. Emission-related components also include any other part whose primary purpose is to reduce emissions or whose failure would commonly increase emissions without significantly degrading engine/equipment performance.

Department of Transportation

National Highway Traffic Safety Administration

49 CFR Chapter V

In consideration of the foregoing, under the authority of 49 U.S.C. 322, 5 U.S.C. 552, 49 U.S.C. 30166, 49 U.S.C. 30167, 49 U.S.C. 32307, 49 U.S.C. 32505, 49 U.S.C. 32708, 49 U.S.C. 32910, 49 U.S.C. 33116, 49 U.S.C. 32901, 49 U.S.C. 32902, 49 U.S.C. 30101, 49 U.S.C. 32905, 49 U.S.C. 32906, and delegation of authority at 49 CFR 1.95, NHTSA amends 49 CFR chapter V as follows:

PART 523—VEHICLE CLASSIFICATION

■ 374. Revise the authority citation for part 523 to read as follows:

Authority: 49 U.S.C. 32901; delegation of authority at 49 CFR 1.95.

■ 375. Revise § 523.2 to read as follows:

§ 523.2 Definitions.

As used in this part:

Ambulance has the meaning given in 40 CFR 86.1803.

Approach angle means the smallest angle, in a plane side view of an automobile, formed by the level surface on which the automobile is standing and a line tangent to the front tire static loaded radius arc and touching the underside of the automobile forward of the front tire.

Axle clearance means the vertical distance from the level surface on which an automobile is standing to the lowest point on the axle differential of the automobile.

Base tire (for passenger automobiles, light trucks, and medium duty passenger vehicles) means the tire size specified as standard equipment by the manufacturer on each unique combination of a vehicle's footprint and model type. Standard equipment is defined in 40 CFR 86.1803.

Basic vehicle frontal area is used as defined in 40 CFR 86.1803 for passenger automobiles, light trucks, medium duty passenger vehicles and Class 2b through 3 pickup trucks and vans. For heavy-duty tracts and vocational vehicles, it has the meaning given in 40 CFR 1037.801.

Breakover angle means the supplement of the largest angle, in the plan side view of an automobile that can be formed by two lines tangent to the front and rear static loaded radii arcs and intersecting at a point on the underside of the automobile.

Bus has the meaning given in 49 CFR 571.3.

Cab-complete vehicle means a vehicle that is first sold as an incomplete vehicle that substantially includes the vehicle cab section as defined in 40 CFR 1037.801. For example, vehicles known commercially as chassis-cabs, cab-chassis, box-deletes, bed-deletes, and cut-away vans are considered cab-complete vehicles. A cab includes a steering column and a passenger compartment. Note that a vehicle lacking some components of the cab is a cab-complete vehicle if it substantially includes the cab.

Cargo-carrying volume means the luggage capacity or cargo volume index, as appropriate, and as those terms are defined in 40 CFR 600.315–08, in the case of automobiles to which either of these terms apply. With respect to automobiles to which neither of these terms apply, “cargo-carrying volume” means the total volume in cubic feet, rounded to the nearest 0.1 cubic feet, of either an automobile's enclosed nonseating space that is intended primarily for carrying cargo and is not accessible from the passenger compartment, or the space intended primarily for carrying cargo bounded in the front by a vertical plane that is perpendicular to the longitudinal centerline of the automobile and passes through the rearmost point on the rearmost seat and elsewhere by the automobile's interior surfaces.

Class 2b vehicles are vehicles with a gross vehicle weight rating (GVWR) ranging from 8,501 to 10,000 pounds.

Class 3 through Class 8 vehicles are vehicles with a gross vehicle weight rating (GVWR) of 10,001 pounds or more as defined in 49 CFR 565.15.

Coach bus has the meaning given in 40 CFR 1037.801.

Commercial medium- and heavy-duty on-highway vehicle means an on-highway vehicle with a gross vehicle weight rating of 10,000 pounds or more as defined in 49 U.S.C. 32901(a)(7).

Complete vehicle has the meaning given to *completed vehicle* as defined in 49 CFR 567.3.

Concrete mixer has the meaning given in 40 CFR 1037.801.

Curb weight has the meaning given in 49 CFR 571.3.

Dedicated vehicle has the same meaning as dedicated automobile as defined in 49 U.S.C. 32901(a)(8).

Departure angle means the smallest angle, in a plane side view of an automobile, formed by the level surface on which the automobile is standing and a line tangent to the rear tire static loaded radius arc and touching the underside of the automobile rearward of the rear tire.

Dual-fueled vehicle (multi-fuel, or flexible-fuel vehicle) has the same meaning as dual fueled automobile as defined in 49 U.S.C. 32901(a)(9).

Electric vehicle means a vehicle that does not include an engine, and is powered solely by an external source of electricity and/or solar power. Note that this does not include electric hybrid or fuel-cell vehicles that use a chemical fuel such as gasoline, diesel fuel, or hydrogen. Electric vehicles may also be referred to as all-electric vehicles to distinguish them from hybrid vehicles.

Emergency vehicle means one of the following:

(1) For passenger cars, light trucks and medium duty passenger vehicles, emergency vehicle has the meaning given in 49 U.S.C. 32902(e).

(2) For heavy-duty vehicles, emergency vehicle has the meaning given in 40 CFR 1037.801.

Engine code has the meaning given in 40 CFR 86.1803.

Final stage manufacturer has the meaning given in 49 CFR 567.3.

Fire truck has the meaning given in 40 CFR 86.1803.

Footprint is defined as the product of track width (measured in inches, calculated as the average of front and rear track widths, and rounded to the nearest tenth of an inch) times wheelbase (measured in inches and rounded to the nearest tenth of an inch), divided by 144 and then rounded to the nearest tenth of a square foot. For purposes of this definition, track width is the lateral distance between the centerlines of the base tires at ground, including the camber angle. For purposes of this definition, wheelbase is the longitudinal distance between front and rear wheel centerlines.

Full-size pickup truck means a light truck or medium duty passenger vehicle that meets the requirements specified in 40 CFR 86.1866–12(e).

Gross axle weight rating (GAWR) has the meaning given in 49 CFR 571.3.

Gross combination weight rating (GCWR) has the meaning given in 49 CFR 571.3.

Gross vehicle weight rating (GVWR) has the meaning given in 49 CFR 571.3.

Heavy-duty engine means any engine used for (or for which the engine manufacturer could reasonably expect to be used for) motive power in a heavy-duty vehicle. For purposes of this definition in this part, the term “engine” includes internal combustion engines and other devices that convert chemical fuel into motive power. For example, a fuel cell and motor used in a heavy-duty vehicle is a heavy-duty engine. Heavy duty-engines include those engines subject to the standards in 49 CFR part 535.

Heavy-duty vehicle means a vehicle as defined in § 523.6.

Hitch means a device attached to the chassis of a vehicle for towing.

Incomplete vehicle has the meaning given in 49 CFR 567.3.

Light truck means a non-passenger automobile meeting the criteria in § 523.5.

Manufacturer has the meaning given in 49 U.S.C. 32901(a)(14).

Medium duty passenger vehicle means a vehicle which would satisfy the criteria in § 523.5 (relating to light trucks) but for its gross vehicle weight rating or its curb weight, which is rated at more than 8,500 lbs GVWR or has a vehicle curb weight of more than 6,000 pounds or has a basic vehicle frontal area in excess of 45 square feet, and which is designed primarily to transport passengers, but does not include a vehicle that—

(1) Is an “incomplete vehicle” as defined in this subpart; or

(2) Has a seating capacity of more than 12 persons; or

(3) Is designed for more than 9 persons in seating rearward of the driver’s seat; or

(4) Is equipped with an open cargo area (for example, a pick-up truck box or bed) of 72.0 inches in interior length or more. A covered box not readily accessible from the passenger compartment will be considered an open cargo area for purposes of this definition.

Mild hybrid gasoline-electric vehicle means a vehicle as defined by EPA in 40 CFR 86.1866–12(e).

Motor home has the meaning given in 49 CFR 571.3.

Motor vehicle has the meaning given in 49 U.S.C. 30102.

Passenger-carrying volume means the sum of the front seat volume and, if any, rear seat volume, as defined in 40 CFR 600.315–08, in the case of automobiles to which that term applies. With respect

to automobiles to which that term does not apply, “passenger-carrying volume” means the sum in cubic feet, rounded to the nearest 0.1 cubic feet, of the volume of a vehicle’s front seat and seats to the rear of the front seat, as applicable, calculated as follows with the head room, shoulder room, and leg room dimensions determined in accordance with the procedures outlined in Society of Automotive Engineers Recommended Practice J1100, Motor Vehicle Dimensions (Report of Human Factors Engineering Committee, Society of Automotive Engineers, approved November 2009).

(1) For front seat volume, divide 1,728 into the product of the following SAE dimensions, measured in inches to the nearest 0.1 inches, and round the quotient to the nearest 0.001 cubic feet.

(i) H61-Effective head room—front.

(ii) W3-Shoulder room—front.

(iii) L34-Maximum effective leg room—accelerator.

(2) For the volume of seats to the rear of the front seat, divide 1,728 into the product of the following SAE dimensions, measured in inches to the nearest 0.1 inches, and rounded the quotient to the nearest 0.001 cubic feet.

(i) H63-Effective head room—second.

(ii) W4-Shoulder room—second.

(iii) L51-Minimum effective leg room—second.

Pickup truck means a non-passenger automobile which has a passenger compartment and an open cargo area (bed).

Pintle hooks means a type of towing hitch that uses a tow ring configuration to secure to a hook or a ball combination for the purpose of towing.

Recreational vehicle or RV means a motor vehicle equipped with living space and amenities found in a motor home.

Refuse hauler has the meaning given in 40 CFR 1037.801.

Running clearance means the distance from the surface on which an automobile is standing to the lowest point on the automobile, excluding unsprung weight.

School bus has the meaning given in 49 CFR 571.3.

Static loaded radius arc means a portion of a circle whose center is the center of a standard tire-rim combination of an automobile and whose radius is the distance from that center to the level surface on which the automobile is standing, measured with the automobile at curb weight, the wheel parallel to the vehicle’s longitudinal centerline, and the tire inflated to the manufacturer’s recommended pressure.

Strong hybrid gasoline-electric vehicle means a vehicle as defined by EPA in 40 CFR 86.1866–12(e).

Temporary living quarters means a space in the interior of an automobile in which people may temporarily live and which includes sleeping surfaces, such as beds, and household conveniences, such as a sink, stove, refrigerator, or toilet.

Transmission class has the meaning given in 40 CFR 600.002.

Transmission configuration has the meaning given in 40 CFR 600.002.

Transmission type has the meaning given in 40 CFR 86.1803.

Truck tractor has the meaning given in 49 CFR 571.3 and 49 CFR 535.5(c). This includes most heavy-duty vehicles specifically designed for the primary purpose of pulling trailers, but does not include vehicles designed to carry other loads. For purposes of this definition “other loads” would not include loads carried in the cab, sleeper compartment, or toolboxes. Examples of vehicles that are similar to tractors but that are not tractors under this part include dromedary tractors, automobile haulers, straight trucks with trailers hitches, and tow trucks.

Van means a vehicle with a body that fully encloses the driver and a cargo carrying or work performing compartment. The distance from the leading edge of the windshield to the foremost body section of vans is typically shorter than that of pickup trucks and sport utility vehicles.

Vocational tractor means a tractor that is classified as a vocational vehicle according to 40 CFR 1037.630

Vocational vehicle (or heavy-duty vocational vehicle) has the meaning given in § 523.8 and 49 CFR 535.5(b). This includes any vehicle that is equipped for a particular industry, trade or occupation such as construction, heavy hauling, mining, logging, oil fields, refuse and includes vehicles such as school buses, motorcoaches and RVs.

Work truck means a vehicle that is rated at more than 8,500 pounds and less than or equal to 10,000 pounds gross vehicle weight, and is not a medium-duty passenger vehicle as defined in 49 U.S.C. 32901(a)(19).

■ 376. Revise § 523.6 to read as follows:

§ 523.6 Heavy-duty vehicle.

(a) A heavy-duty vehicle is any commercial medium or heavy-duty on-highway vehicle or a work truck, as defined in 49 U.S.C. 32901(a)(7) and (19). For the purpose of this section, heavy-duty vehicles are divided into four regulatory categories as follows:

(1) Heavy-duty pickup trucks and vans;

(2) Heavy-duty vocational vehicles;

(3) Truck tractors with a GVWR above 26,000 pounds; and

(4) Heavy-duty trailers.

(b) The heavy-duty vehicle classification does not include vehicles excluded as specified in 49 CFR 535.3.

■ 377. Revise § 523.7 to read as follows:

§ 523.7 Heavy-duty pickup trucks and vans.

(a) Heavy-duty pickup trucks and vans are pickup trucks and vans with a gross vehicle weight rating between 8,501 pounds and 14,000 pounds (Class 2b through 3 vehicles) manufactured as complete vehicles by a single or final stage manufacturer or manufactured as incomplete vehicles as designated by a manufacturer. See references in 40 CFR 86.1801–12, 40 CFR 86.1819–17, 40 CFR 1037.150, and 49 CFR 535.5(a).

(b) Heavy duty vehicles above 14,000 pounds GVWR may be optionally certified as heavy-duty pickup trucks and vans and comply with fuel consumption standards in 49 CFR 535.5(a), if properly included in a test group with similar vehicles at or below 14,000 pounds GVWR. Fuel consumption standards apply to these vehicles as if they were Class 3 heavy-duty vehicles. The work factor for these vehicles may not be greater than the largest work factor that applies for vehicles in the test group that are at or below 14,000 pounds GVWR (see 40 CFR 86.1819–14).

(c) Incomplete heavy-duty vehicles at or below 14,000 pounds GVWR may be optionally certified as heavy-duty pickup trucks and vans and comply with to the fuel consumption standards in 49 CFR 535.5(a).

■ 378. Add § 523.10 to read as follows:

§ 523.10 Heavy-duty trailers.

(a) A trailer means a motor vehicle with or without motive power, designed for carrying cargo and for being drawn by another motor vehicle as defined in 49 CFR 571.3. For the purpose of this part, heavy-duty trailers include only those trailers designed to be drawn by a truck tractor excluding non-box trailers other than flatbed trailer, tanker trailers and container chassis and those that are coupled to vehicles exclusively by pintle hooks or hitches instead of a fifth wheel. Heavy-duty trailers may be divided into different types and categories as follows:

(1) Box vans are trailers with enclosed cargo space that is permanently attached to the chassis, with fixed sides, nose, and roof. Tank trailers are not box vans.

(2) Box van with front-mounted HVAC systems are refrigerated vans. Note that this includes systems that

provide cooling, heating, or both. All other box vans are dry vans.

(3) Trailers that are not box vans are non-box trailers. Note that the standards for non-box trailers in 49 CFR 535.5(e)(2) apply only to flatbed trailers, tank trailers, and container chassis.

(4) Box van with a length greater than 50 feet are long box vans. Other box vans are short box vans.

(5) The following types of equipment are not trailers:

(i) Containers that are not

permanently mounted on chassis.

(ii) Dollies used to connect tandem trailers.

(iii) Equipment that serves similar purposes but are not intended to be pulled by a tractor.

(b) Heavy-duty trailers do not include trailers excluded in 49 CFR 535.3.

PART 534—RIGHTS AND RESPONSIBILITIES OF MANUFACTURERS IN THE CONTEXT OF CHANGES IN CORPORATE RELATIONSHIPS

■ 379. Revise the authority citation for part 534 to read as follows:

Authority: 49 U.S.C. 32901; delegation of authority at 49 CFR 1.95.

■ 380. Add § 534.8 to read as follows:

§ 534.8 Shared corporate relationships.

(a) Vehicles and engines built by multiple manufacturers can share responsibility for complying with fuel consumption standards in 49 CFR part 535, by following the EPA requirements in 40 CFR 1037.620 and by sending a joint agreement between the parties to EPA and NHTSA before submitting any certificates of conformity for the applicable vehicles or engines in accordance with 40 CFR part 1036, subpart C, and 40 CFR part 1037, subpart C.

(1) Each joint agreement must—

(i) Define how each manufacturer shares responsibility for the planned vehicles or engines.

(ii) Specify which manufacturer(s) will be responsible for the EPA certificates of conformity;

(iii) Describe the planned vehicles and engines in terms of the model types, production volumes, and model years (if known);

(iv) Describe which manufacturer(s) have engineering and design control and sale distribution ownership over the vehicles and/or engines; and

(v) Include signatures from all parties involved in the shared corporate relationship.

(2) After defining the shared relationship between the manufacturers, any contractual changes must be

notified to EPA and NHTSA before the next model year's production of the applicable vehicles or engines begins.

(3) Multiple manufacturers must designate the same shared responsibility for complying with fuel consumption standards as selected for GHG standards unless otherwise allowed by EPA and NHTSA.

(b) NHTSA and EPA reserve the right to reject the joint agreement.

■ 381. Revise part 535 to read as follows:

PART 535 MEDIUM-AND HEAVY-DUTY VEHICLE FUEL EFFICIENCY PROGRAM

Sec.

535.1 Scope.

535.2 Purpose.

535.3 Applicability.

535.4 Definitions.

535.5 Standards.

535.6 Measurement and calculation procedures.

535.7 Averaging, banking, and trading (ABT) credit program.

535.8 Reporting and recordkeeping requirements.

535.9 Enforcement approach.

535.10 How do manufacturers comply with fuel consumption standards?

Authority: 49 U.S.C. 32902 and 30101; delegation of authority at 49 CFR 1.95.

§ 535.1 Scope.

This part establishes fuel consumption standards pursuant to 49 U.S.C. 32902(k) for work trucks and commercial medium- and heavy-duty on-highway vehicles, including trailers (hereafter referenced as heavy-duty vehicles), and engines manufactured for sale in the United States. This part establishes a credit program manufacturers may use to comply with standards and requirements for manufacturers to provide reports to the National Highway Traffic Safety Administration regarding their efforts to reduce the fuel consumption of heavy-duty vehicles and engines.

§ 535.2 Purpose.

The purpose of this part is to reduce the fuel consumption of new heavy-duty vehicles and engines by establishing maximum levels for fuel consumption standards while providing a flexible credit program to assist manufacturers in complying with standards.

§ 535.3 Applicability.

(a) This part applies to manufacturers that produce complete and incomplete heavy-duty vehicles as defined in 49 CFR part 523, and to the manufacturers of all heavy-duty engines manufactured for use in the applicable vehicles for each given model year.

(b) This part also applies to alterers, final stage manufacturers, and intermediate manufacturers producing vehicles and engines or assembling motor vehicles or motor vehicle equipment under special conditions. Manufacturers comply with this part by following the special conditions in 40 CFR 1037.620, 1037.621, and 1037.622 in which EPA allows manufacturer to:

(1) Share responsibility for the vehicles they produce. Manufacturers sharing responsibility for complying with emissions and fuel consumption standards must submit to the agencies a joint agreement as specified in 49 CFR 534.8(a);

(2) Have certificate holders sell or ship vehicles that are missing certain emission-related components to be installed by secondary vehicle manufacturers;

(3) Ship partially complete vehicles to secondary manufacturers;

(4) Build electric vehicles; and

(5) Build alternative fueled vehicles from all types of heavy duty engine conversions. The conversion manufacturer must:

(i) Install alternative fuel conversion systems into vehicles acquired from vehicle manufacturers prior to first retail sale or prior to the vehicle's introduction into interstate commerce.

(ii) Be designated by the vehicle manufacturer and EPA to be the certificate holder.

(iii) Omit alternative fueled vehicles from compliance with vehicle fuel consumption standards, if—

(A) Excluded from EPA emissions standards; and

(B) A reasonable technical basis exist that the modified vehicle continues to meet emissions and fuel consumption vehicle standards.

(c) Vehicle and engine manufacturers that must comply with this part include manufacturers required to have approved certificates of conformity from EPA as specified in 40 CFR parts 86, 1036, and 1037.

(d) The following heavy-duty vehicles and engines are excluded from the requirements of this part:

(1) Vehicles and engines manufactured prior to January 1, 2014, unless certified early under NHTSA's voluntary provisions in § 535.5.

(2) Medium-duty passenger vehicles and other vehicles subject to the light-duty corporate average fuel economy standards in 49 CFR parts 531 and 533.

(3) Recreational vehicles, including motor homes manufactured before January 1, 2021, except those produced by manufacturers voluntarily complying with NHTSA's early vocational

standards for model years 2013 through 2020.

(4) Aircraft vehicles meeting the definition of "motor vehicle". For example, this would include certain convertible aircraft that can be adjusted to operate on public roads.

(5) Heavy-duty trailers as defined in 49 CFR 523.10 meeting one or more of the following criteria are excluded from trailer standards in § 535.5(e):

(i) Trailers with four or more axles and trailers less than 35 feet long with three axles (*i.e.*, trailers intended for hauling very heavy loads).

(ii) Trailers intended for temporary or permanent residence, office space, or other work space, such as campers, mobile homes, and carnival trailers.

(iii) Trailers with a gap of at least 120 inches between adjacent axle centerlines. In the case of adjustable axle spacing, this refers to the closest possible axle positioning.

(iv) Trailers built before January 1, 2021, except those trailers built by manufacturers after January 1, 2018, and voluntarily complying with NHTSA's early trailer standards for model years 2018 through 2020.

(v) Note that the definition of "heavy-duty trailer" in 49 CFR 523.10 excludes equipment that serves similar purposes but are not intended to be pulled by a tractor. This exclusion applies to such equipment whether or not they are known commercially as trailers. For example, any equipment pulled by a heavy-duty vehicle with a pintle hook or hitch instead of a fifth wheel does not qualify as a trailer under this part.

(6) Engines installed in heavy-duty vehicles that are not used to propel vehicles. Note, this includes engines used to indirectly propel vehicles (such as electrical generator engines that power to batteries for propulsion).

(7) The provisions of this part do not apply to engines that are not internal combustion engines. For example, the provisions of this part do not apply to fuel cells. Note that gas turbine engines are internal combustion engines.

(e) The following heavy-duty vehicles and engines are exempted from the requirements of this part:

(1) *Off-road vehicles.* Vehicle manufacturers producing vehicles intended for off-road may exempt vehicles without requesting approval from the agencies subject to the criteria in § 535.5(b)(9)(i) and 40 CFR 1037.631(a). If unusual circumstances exist and a manufacturer is uncertain as to whether its vehicles qualify, the manufacturer should ask for a preliminary determination from the agencies before submitting its application for certification in

accordance with 40 CFR 1037.205 for the applicable vehicles. Send the request with supporting information to EPA and the agencies will coordinate in making a preliminary determination as specified in 40 CFR 1037.210. These decisions are considered to be preliminary approvals and subject to final review and approval.

(2) *Small business manufacturers.* (i) For Phase 1, small business manufacturers are exempted from the vehicle and engine standards of § 535.5, but must comply with the reporting requirements of § 535.8(g).

(ii) For Phase 2, fuel consumption standards apply on a delayed schedule for manufacturers meeting the small business criteria specified in 13 CFR 121.201 and in 40 CFR 86.1819–14(k)(5), 40 CFR 1036.150, and 40 CFR 1037.150. Qualifying manufacturers of truck tractors, vocational vehicles, heavy duty pickups and vans, and engines are not subject to the fuel consumption standards for vehicles built before January 1, 2022 and engines (such as those engines built by small alternative fuel engine converters) with a date of manufacturer on or after November 14, 2011 and before January 1, 2022. Qualifying manufacturers may choose to voluntarily comply early.

(iii) Small business manufacturers producing vehicles and engines that run on any fuel other than gasoline, E85, or diesel fuel meeting the criteria specified in 13 CFR 121.201 and in 40 CFR 86.1819–14(k)(5), 40 CFR 1036.150, and 40 CFR 1037.150 may delay complying with every new mandatory standard under this part by one model year.

(3) *Transitional allowances for trailers.* Through model year 2026, trailer manufacturers may calculate a number of trailers that are exempt from the fuel consumption standards of this part. Calculate the number of exempt box vans in a given model year by multiplying the manufacturer's total U.S.-directed production volume of certified box vans by 0.20 and rounding to the nearest whole number; however, in no case may the number of exempted box vans be greater than 350 units in any given model year. Repeat this calculation to determine the number of non-box trailers, up to 250 annual units, that are exempt from standards and certification requirements.

Manufacturers perform the calculation based on their projected production volumes in the first year that standards apply; in later years, use actual production volumes from the preceding model year. Manufacturers must include these calculated values and the production volumes of exempt trailers

in their annual production reports required under § 535.8(g)(12).

(4) *Engines for specialty vehicles.*

Engines certified to the alternative standards specified in 40 CFR 86.007–11 and 86.008–10 for use in specialty vehicles as described in 40 CFR 1037.605. Compliance with the vehicle provisions in 40 CFR 1037.605 satisfies compliance for NHTSA under this part.

(f) For model year 2021 and later, vocational vehicle manufacturers building custom chassis vehicles (e.g. emergency vehicles) may be exempted from standards in § 535.5(b)(4) and may comply with alternative fuel consumption standards as specified in § 535.5(b)(6). Manufacturers complying with alternative fuel consumption standards in § 535.5(b)(6) are restricted in using fuel consumption credits as specified in § 535.7(c).

(g) The fuel consumption standards in some cases apply differently for spark-ignition and compression-ignition engines or vehicles as specified in 40 CFR parts 1036 and 1037. Engine requirements are similarly differentiated by engine type and by primary intended service class, as described in 40 CFR 1036.140.

(h) NHTSA may exclude or exempt vehicles and engines under special conditions allowed by EPA in accordance with 40 CFR parts 85, 86, 1036, 1037, 1039, and 1068. Manufacturers should consult the agencies if uncertain how to apply any EPA provision under the NHTSA fuel consumption program. It is recommended that manufacturers seek clarification before producing a vehicle. Upon notification by EPA of a fraudulent use of an exemption, NHTSA reserves that right to suspend or revoke any exemption or exclusion.

(i) In cases where there are differences between the application of this part and the corresponding EPA program regarding whether a vehicle is regulated or not (such as due to differences in applicability resulting from differing agency definitions, etc.), manufacturers should contact the agencies to identify these vehicles and assess the applicability of the agencies' standards. The agencies will provide guidance on how the vehicles can comply. Manufacturers are required to identify these vehicles in their final reports submitted in accordance with § 535.8.

§ 535.4 Definitions.

The terms manufacture and manufacturer are used as defined in section 501 of the Act and the terms commercial medium-duty and heavy-duty on highway vehicle, fuel and work truck are used as defined in 49 U.S.C.

32901. See 49 CFR 523.2 for general definitions related to NHTSA's fuel efficiency programs.

Act means the Motor Vehicle Information and Cost Savings Act, as amended by Pub. L. 94–163 and 96–425.

Administrator means the Administrator of the National Highway Traffic Safety Administration (NHTSA) or the Administrator's delegate.

Advanced technology means vehicle technology under this fuel consumption program in §§ 535.6 and 535.7 and by EPA under 40 CFR 86.1819–14(d)(7), 1036.615, or 1037.615.

Alterers means a manufacturer that modifies an altered vehicle as defined in 49 CFR 567.3

Alternative fuel conversion has the meaning given for clean alternative fuel conversion in 40 CFR 85.502.

A to B testing has the meaning given in 40 CFR 1037.801.

Automated manual transmission has the meaning given in 40 CFR 1037.801.

Automatic tire inflation system has the meaning given in 40 CFR 1037.801.

Automatic transmission (AT) has the meaning given in 40 CFR 1037.801.

Auxiliary power unit has the meaning given in 40 CFR 1037.801.

Averaging set means, a set of engines or vehicles in which fuel consumption credits may be exchanged. Credits generated by one engine or vehicle family may only be used by other respective engine or vehicle families in the same averaging set as specified in § 535.7. Note that an averaging set may comprise more than one regulatory subcategory. The averaging sets for this HD program are defined as follows:

- (1) Heavy-duty pickup trucks and vans.
- (2) Light heavy-duty (LHD) vehicles.
- (3) Medium heavy-duty (MHD) vehicles.
- (4) Heavy heavy-duty (HHD) vehicles.
- (5) Light heavy-duty engines subject to compression-ignition standards.
- (6) Medium heavy-duty engines subject to compression-ignition standards.
- (7) Heavy heavy-duty engines subject to compression-ignition standards.
- (8) Engines subject to spark-ignition standards.
- (9) Long trailers.
- (10) Short trailers.
- (11) Vehicle types certifying to optional custom chassis standards as specified in § 535.5(b)(6) form separate averaging sets for each vehicle type as specified in § 535.7(c).

Axle ratio or Drive axle ratio, k_a has the meaning given in 40 CFR 1037.801.

Basic vehicle frontal area has the meaning given in 40 CFR 1037.801.

Cab-complete vehicle has the meaning given in 49 CFR 523.2.

Carryover has the meaning given in 40 CFR 1037.801.

Certificate holder means the manufacturer who holds the certificate of conformity for the vehicle or engine and that assigns the model year based on the date when its manufacturing operations are completed relative to its annual model year period.

Certificate of Conformity means an approval document granted by EPA to a manufacturer that submits an application for a vehicle or engine emissions family in 40 CFR 1036.205 and 1037.205. A certificate of conformity is valid from the indicated effective date until December 31 of the model year for which it is issued. The certificate must be renewed annually for any vehicle a manufacturer continues to produce.

Certification has the meaning given in 40 CFR 1037.801.

Certified emission level has the meaning given in 40 CFR 1036.801.

Chassis-cab means the incomplete part of a vehicle that includes a frame, a completed occupant compartment and that requires only the addition of cargo-carrying, work-performing, or load-bearing components to perform its intended functions.

Chief Counsel means the NHTSA Chief Counsel, or his or her designee.

Class means relating to GVWR classes for vehicles other than trailers, as follows:

(1) *Class 2b vehicles* are vehicles with a gross vehicle weight rating (GVWR) ranging from 8,501 to 10,000 pounds.

(2) *Class 3 through Class 8 vehicles* are vehicles with a gross vehicle weight rating (GVWR) of 10,001 pounds or more as defined in 49 CFR 565.15.

Complete sister vehicle is a complete vehicle of the same configuration as a cab-complete vehicle.

Complete vehicle has the meaning given in 49 CFR part 523.

Compression-ignition (CI) means relating to a type of reciprocating, internal-combustion engine, such as a diesel engine, that is not a spark-ignition engine. Note, in accordance with 40 CFR 1036.1, gas turbine engines and other engines not meeting the definition of compression-ignition are deemed to be compression-ignition engines for complying with fuel consumption standards.

Configuration means a subclassification within a test group for passenger cars, light trucks and medium-duty passenger vehicles and heavy-duty pickup trucks and vans which is based on basic engine, engine code, transmission type and gear ratios, and final drive ratio.

Container chassis trailer has the same meaning as container chassis in 40 CFR 1037.801.

Curb weight has the meaning given in 40 CFR 86.1803.

Custom chassis vehicle means a vocational vehicle that is a motor home, school bus, refuse hauler, concrete mixer, emergency vehicle, mixed-use vehicle or other buses that are not school buses or motor coaches. These vehicle types are defined in 49 CFR 523.3. A "mixed-use vehicle" is one that meets at least one of the criteria specified in 40 CFR 1037.631(a)(1) or at least one of the criteria in 40 CFR 1037.631(a)(2), but not both.

Date of manufacture means the date on which the certifying vehicle manufacturer completes its manufacturing operations, except as follows:

(1) Where the certificate holder is an engine manufacturer that does not manufacture the complete or incomplete vehicle, the date of manufacture of the vehicle is based on the date assembly of the vehicle is completed.

(2) EPA and NHTSA may approve an alternate date of manufacture based on the date on which the certifying (or primary) vehicle manufacturer completes assembly at the place of main assembly, consistent with the provisions of 40 CFR 1037.601 and 49 CFR 567.4.

(3) A vehicle manufacturer that completes assembly of a vehicle at two or more facilities may ask to use as the month and year of manufacture, for that vehicle, the month and year in which manufacturing is completed at the place of main assembly, consistent with provisions of 49 CFR 567.4, as the model year. Note that such staged assembly is subject to the provisions of 40 CFR 1068.260(c). NHTSA's allowance of this provision is effective when EPA approves the manufacturer's certificates of conformity for these vehicles.

Day cab has the meaning given in 40 CFR 1037.801.

Drayage tractor has the meaning given in 40 CFR 1037.801.

Dual-clutch transmission (DCT) means a transmission has the meaning given in 40 CFR 1037.801.

Dual-fuel has the meaning given in 40 CFR 1037.801.

Electric vehicle has the meaning given in 40 CFR 1037.801.

Emergency vehicle means a vehicle that meets one of the criteria in 40 CFR 1037.801.

Engine family has the meaning given in 40 CFR 1036.230. Manufacturers designate families in accordance with EPA provisions and may not choose

different families between the NHTSA and EPA programs.

Excluded means a vehicle or engine manufacturer or component is not required to comply with any aspects with the NHTSA fuel consumption program.

Exempted means a vehicle or engine manufacturer or component is not required to comply with certain provisions of the NHTSA fuel consumption program.

Family certification level (FCL) has the meaning given in 40 CFR 1036.801.

Family emission limit (FEL) has the meaning given in 40 CFR 1037.801.

Final drive ratio has the meaning given in 40 CFR 1037.801.

Final-stage manufacturer has the meaning given in 49 CFR 567.3 and includes secondary vehicle manufacturers as defined in 40 CFR 1037.801.

Flatbed trailer has the meaning given in 40 CFR 1037.801.

Fleet in this part means all the heavy-duty vehicles or engines within each of the regulatory sub-categories that are manufactured by a manufacturer in a particular model year and that are subject to fuel consumption standards under § 535.5.

Fleet average fuel consumption is the calculated average fuel consumption performance value for a manufacturer's fleet derived from the production weighted fuel consumption values of the unique vehicle configurations within each vehicle model type that makes up that manufacturer's vehicle fleet in a given model year. In this part, the fleet average fuel consumption value is determined for each manufacturer's fleet of heavy-duty pickup trucks and vans.

Fleet average fuel consumption standard is the actual average fuel consumption standard for a manufacturer's fleet derived from the production weighted fuel consumption standards of each unique vehicle configuration, based on payload, tow capacity and drive configuration (2, 4 or all-wheel drive), of the model types that makes up that manufacturer's vehicle fleet in a given model year. In this part, the fleet average fuel consumption standard is determined for each manufacturer's fleet of heavy-duty pickup trucks and vans.

Fuel cell means an electrochemical cell that produces electricity via the non-combustion reaction of a consumable fuel, typically hydrogen.

Fuel cell electric vehicle means a motor vehicle propelled solely by an electric motor where energy for the motor is supplied by a fuel cell.

Fuel efficiency means the amount of work performed for each gallon of fuel consumed.

Gaseous fuel has the meaning given in 40 CFR 1037.801.

Greenhouse gas Emissions Model (GEM) has the meaning given in 40 CFR 1037.801.

Gross axle weight rating (GAWR) has the meaning given in 49 CFR 571.3.

Gross combination weight rating (GCWR) has the meaning given in 49 CFR 571.3.

Gross vehicle weight rating (GVWR) has the meaning given in 49 CFR 571.3.

Good engineering judgment has the meaning given in 40 CFR 1068.30. See 40 CFR 1068.5 for the administrative process used to evaluate good engineering judgment.

Heavy-duty off-road vehicle means a heavy-duty vocational vehicle or vocational tractor that is intended for off-road use.

Heavy-duty vehicle has the meaning given in 49 CFR part 523.

Heavy-haul tractor has the meaning given in 40 CFR 1037.801.

Heavy heavy-duty (HHD) vehicle has the meaning given in vehicle service class.

Hybrid engine or hybrid powertrain means an engine or powertrain that includes energy storage features other than a conventional battery system or conventional flywheel. Supplemental electrical batteries and hydraulic accumulators are examples of hybrid energy storage systems. Note that certain provisions in this part treat hybrid engines and powertrains intended for vehicles that include regenerative braking different than those intended for vehicles that do not include regenerative braking.

Hybrid vehicle means a vehicle that includes energy storage features (other than a conventional battery system or conventional flywheel) in addition to an internal combustion engine or other engine using consumable chemical fuel. Supplemental electrical batteries and hydraulic accumulators are examples of hybrid energy storage systems. Note that certain provisions in this part treat hybrid vehicles that include regenerative braking different than those that do not include regenerative braking.

Idle operation has the meaning given in 40 CFR 1037.801.

Incomplete vehicle has the meaning given in 49 CFR part 523. For the purpose of this regulation, a manufacturer may request EPA and NHTSA to allow the certification of a vehicle as an incomplete vehicle if it manufactures the engine and sells the unassembled chassis components, provided it does not produce and sell

the body components necessary to complete the vehicle.

Innovative technology means technology certified under § 535.7 and by EPA under 40 CFR 86.1819–14(d)(13), 1036.610, and 1037.610 in the Phase 1 program.

Intermediate manufacturer has the meaning given in 49 CFR 567.3.

Light heavy-duty (LHD) vehicle has the meaning given in vehicle service class.

Liquefied petroleum gas (LPG) has the meaning given in 40 CFR 1036.801.

Low rolling resistance tire means a tire on a vocational vehicle with a tire rolling resistance level (TRRL) of 7.7 kg/metric ton or lower, a steer tire on a tractor with a TRRL of 7.7 kg/metric ton or lower, or a drive tire on a tractor with a TRRL of 8.1 kg/metric ton or lower.

Manual transmission (MT) has the meaning given in 40 CFR 1037.801.

Medium heavy-duty (MHD) vehicle has the meaning given in vehicle service class.

Model type has the meaning given in 40 CFR 600.002.

Model year as it applies to vehicles means:

(1) For tractors and vocational vehicles with a date of manufacture on or after January 1, 2021, the vehicle's *model year* is the calendar year corresponding to the date of manufacture; however, the vehicle's *model year* may be designated to be the year before the calendar year corresponding to the date of manufacture if the engine's *model year* is also from an earlier year. Note that subparagraph (2) of this definition limits the extent to which vehicle manufacturers may install engines built in earlier calendar years. Note that 40 CFR 1037.601(a)(2) limits the extent to which vehicle manufacturers may install engines built in earlier calendar years.

(2) For trailers and for Phase 1 tractors and vocational vehicles with a date of manufacture before January 1, 2021, *model year* means the manufacturer's annual new model production period, except as restricted under this definition. It must include January 1 of the calendar year for which the *model year* is named, may not begin before January 2 of the previous calendar year, and it must end by December 31 of the named calendar year. The *model year* may be set to match the calendar year corresponding to the date of manufacture.

(i) The manufacturer who holds the certificate of conformity for the vehicle must assign the *model year* based on the date when its manufacturing operations are completed relative to its annual

model year period. In unusual circumstances where completion of your assembly is delayed, we may allow you to assign a *model year* one year earlier, provided it does not affect which regulatory requirements will apply.

(ii) Unless a vehicle is being shipped to a secondary manufacturer that will hold the certificate of conformity, the *model year* must be assigned prior to introduction of the vehicle into U.S. commerce. The certifying manufacturer must redesignate the *model year* if it does not complete its manufacturing operations within the originally identified *model year*. A vehicle introduced into U.S. commerce without a *model year* is deemed to have a *model year* equal to the calendar year of its introduction into U.S. commerce unless the certifying manufacturer assigns a later date.

Model year as it applies to engines means the manufacturer's annual new model production period, except as restricted under this definition. It must include January 1 of the calendar year for which the *model year* is named, may not begin before January 2 of the previous calendar year, and it must end by December 31 of the named calendar year. Manufacturers may not adjust *model years* to circumvent or delay compliance with emission standards or to avoid the obligation to certify annually.

Natural gas has the meaning given in 40 CFR 1036.801. Vehicles that use a pilot-ignited natural gas engine (which uses a small diesel fuel ignition system), are still considered natural gas vehicles.

NHTSA Enforcement means the NHTSA Associate Administrator for Enforcement, or his or her designee.

Neutral coasting has the meaning given in 40 CFR 1037.801.

Off-cycle technology means technology certified under § 535.7 and by EPA under 40 CFR 86.1819–14(d)(13), 1036.610, and 1037.610 in the Phase 2 program.

Party means the person alleged to have committed a violation of § 535.9, and includes manufacturers of vehicles and manufacturers of engines.

Payload means in this part the resultant of subtracting the curb weight from the gross vehicle weight rating.

Petroleum has the meaning given in 40 CFR 1037.801.

Phase 1 means the joint NHTSA and EPA program established in 2011 for fuel efficiency standards and greenhouse gas emissions standards regulating medium- and heavy-duty engines and vehicles. See § 535.5 for the specific *model years* that standards apply to vehicles and engines.

Phase 2 means the joint NHTSA and EPA program established in 2016 for fuel efficiency standards and greenhouse gas emissions standards regulating medium- and heavy-duty vehicles including trailers, and engines. See § 535.5 for the specific model years that standards apply to vehicles and engines.

Pickup truck has the meaning given in 49 CFR part 523.

Plug-in hybrid electric vehicle (PHEV) means a hybrid electric vehicle that has the capability to charge the battery or batteries used for vehicle propulsion from an off-vehicle electric source, such that the off-vehicle source cannot be connected to the vehicle while the vehicle is in motion.

Power take-off (PTO) means a secondary engine shaft or other system on a vehicle that provides substantial auxiliary power for purposes unrelated to vehicle propulsion or normal vehicle accessories such as air conditioning, power steering, and basic electrical accessories. A typical PTO uses a secondary shaft on the engine to transmit power to a hydraulic pump that powers auxiliary equipment such as a boom on a bucket truck.

Powertrain family has the meaning given in 40 CFR 1037.231. Manufacturers choosing to perform powertrain testing as specified in 40 CFR 1037.550, divide product lines into powertrain families that are expected to have similar fuel consumptions and CO₂ emission characteristics throughout the useful life.

Preliminary approval means approval granted by an authorized EPA representative prior to submission of an application for certification, consistent with the provisions of 40 CFR 1037.210. For requirements involving NHTSA, EPA will ensure decisions are jointly made and will convey the decision to the manufacturer.

Primary intended service class has the same meaning for engines as specified in 40 CFR 1036.140. Manufacturers must identify a single primary intended service class for each engine family that best describes vehicles for which it designs and markets the engine, as follows:

(1) Divide compression-ignition engines into primary intended service classes based on the following engine and vehicle characteristics:

(i) Light heavy-duty “LHD” engines usually are not designed for rebuild and do not have cylinder liners. Vehicle body types in this group might include any heavy-duty vehicle built from a light-duty truck chassis, van trucks, multi-stop vans, and some straight trucks with a single rear axle. Typical applications would include personal transportation, light-load commercial delivery, passenger service, agriculture, and construction. The GVWR of these vehicles is normally below 19,500 pounds.

(ii) Medium heavy-duty “MHD” engines may be designed for rebuild and may have cylinder liners. Vehicle body types in this group would typically include school buses, straight trucks with single rear axles, city tractors, and a variety of special purpose vehicles such as small dump trucks, and refuse trucks. Typical applications would include commercial short haul and intra-city delivery and pickup. Engines in this group are normally used in vehicles whose GVWR ranges from 19,500 to 33,000 pounds.

(iii) Heavy heavy-duty “HHD” engines are designed for multiple rebuilds and have cylinder liners. Vehicles in this group are normally tractors, trucks, straight trucks with dual rear axles, and buses used in inter-city, long-haul applications. These vehicles normally exceed 33,000 pounds GVWR.

(2) Divide spark-ignition engines into primary intended service classes as follows:

(i) Spark-ignition engines that are best characterized by paragraph (1)(i) or (ii) of this definition are in a separate “spark-ignition” primary intended service class.

(ii) Spark-ignition engines that are best characterized by paragraph (1)(iii) of this definition share a primary intended service class with compression-ignition heavy heavy-duty engines. Gasoline-fueled engines are presumed not to be characterized by paragraph (1)(iii) of this definition; for example, vehicle manufacturers may install some number of gasoline-fueled engines in Class 8 trucks without causing the engine manufacturer to consider those to be heavy heavy-duty engines.

(iii) References to “spark-ignition standards” in this part relate only to the spark-ignition engines identified in

paragraph (b)(1) of this section. References to “compression-ignition standards” in this part relate to compression-ignition engines, to spark-ignition engines optionally certified to standards that apply to compression-ignition engines, and to all engines identified under paragraph (b)(2) of this section as heavy heavy-duty engines.

Rechargeable Energy Storage System (RESS) means the component(s) of a hybrid engine or vehicle that store recovered energy for later use, such as the battery system in a electric hybrid vehicle.

Refuse hauler has the meaning given in 40 CFR 1037.801.

Regional has the meaning relating to the Regional duty cycle as specified in 40 CFR 1037.510.

Regulatory category means each of the four types of heavy-duty vehicles defined in 49 CFR 523.6 and the heavy-duty engines used in these heavy-duty vehicles.

Regulatory subcategory means the sub-groups in each regulatory category to which mandatory fuel consumption standards and requirements apply as specified in 40 CFR 1036.230 and 1037.230 and are defined as follows:

(1) Heavy-duty pick-up trucks and vans.

(2) Vocational vehicle subcategories have 18 separate vehicle service classes as shown in Tables 1 and 2 below and include vocational tractors. Table 1 includes vehicles complying with Phase 1 standards. Phase 2 vehicles are included in Table 2 which have separate subcategories to account for engine characteristics, GVWR, and the selection of duty cycle for vocational vehicles as specified in 40 CFR 1037.510; vehicles may additionally fall into one of the subcategories defined by the custom-chassis standards in § 535.5(b)(6) and 40 CFR 1037.105(h). Manufacturers using the alternate standards in § 535.5(b)(6) and 40 CFR 1037.105(h) should treat each vehicle type as a separate vehicle subcategory.

TABLE 1—PHASE 1 VOCATIONAL VEHICLE SUBCATEGORIES

Vocational LHD vehicles.
Vocational MHD vehicles.
Vocational HHD vehicles.

TABLE 2—PHASE 2 VOCATIONAL VEHICLE SUBCATEGORIES

Engine type	Vocational LHD vehicles	Vocational MHD vehicles	Vocational HHD vehicles
CI	Urban	Urban	Urban.
CI	Multi-Purpose	Multi-Purpose	Multi-Purpose.
CI	Regional	Regional	Regional.

TABLE 2—PHASE 2 VOCATIONAL VEHICLE SUBCATEGORIES—Continued

Engine type	Vocational LHD vehicles	Vocational MHD vehicles	Vocational HHD vehicles
SI	Urban	Urban	NA.
SI	Multi-Purpose	Multi-Purpose	NA.
SI	Regional	Regional	NA.

(3) Tractor subcategories are shown in Table 3 below for Phase 1 and 2. Table 3 includes 10 separate subcategories for tractors complying with Phase 1 and 2 standards. The heavy-haul tractor subcategory only applies for Phase 2.

TABLE 3—PHASE 1 AND 2 TRUCK TRACTOR SUBCATEGORIES

Class 7	Class 8 day cabs	Class 8 sleeper cabs
Low-roof tractors	Low-roof day cab tractors	Low-roof sleeper cab tractors.
Mid-roof tractors	Mid-roof day cab tractors	Mid-roof sleeper cab tractors.
High-roof tractors	High-roof day cab tractors	High-roof sleeper cab tractors.
NA	Heavy-haul tractors (applies only to Phase 2 program).	

(4) Trailer subcategories are shown in Table 4 of this section for the Phase 2 program. Trailers do not comply under the Phase 1 program. Table 4 includes 10 separate subcategories for trailers, which are only subject to Phase 2 only standards.

TABLE 4—TRAILER SUBCATEGORIES

Full-aero trailers	Partial-aero trailers	Other trailers
Long box dry vans	Long box dry vans	Non-aero box vans.
Short box dry vans	Short box dry vans	Non-box trailers.
Long box refrigerated vans	Long box refrigerated vans	NA.
Short box refrigerated vans	Short box refrigerated vans	NA.

(5) Engine subcategories are shown for each primary intended service class in Table 5 below. Table 5 includes 6 separate subcategories for engines which are the same for Phase 1 and 2 standards.

TABLE 5—ENGINE SUBCATEGORIES

LHD engines	MHD engines	HHD engines
CI engines for vocational vehicles	CI engines for vocational vehicles	CI engines for vocational vehicles.
NA	CI engines for truck tractors	CI engines for truck tractors.
All spark-ignition engines		NA.

Revoke has the same meaning given in 40 CFR 1068.30.

Roof height means the maximum height of a vehicle (rounded to the nearest inch), excluding narrow accessories such as exhaust pipes and antennas, but including any wide accessories such as roof fairings. Measure roof height of the vehicle configured to have its maximum height that will occur during actual use, with properly inflated tires and no driver, passengers, or cargo onboard. Determine the base roof height on fully inflated tires having a static loaded radius equal to the arithmetic mean of the largest and smallest static loaded radius of tires a manufacturer offers or a standard tire EPA approves. If a vehicle is equipped with an adjustable roof fairing, measure the roof height with the fairing in its

lowest setting. Once the maximum height is determined, roof heights are divided into the following categories:

- (1) Low-roof means a vehicle with a roof height of 120 inches or less.
- (2) Mid-roof means a vehicle with a roof height between 121 and 147 inches.
- (3) High-roof means a vehicle with a roof height of 148 inches or more.

Secondary vehicle manufacturer has the same meaning as final-stage manufacturer in 49 CFR part 567.

Service class group means a group of engine and vehicle averaging sets defined as follows:

- (1) Spark-ignition engines, light heavy-duty compression-ignition engines, light heavy-duty vocational vehicles and heavy-duty pickup trucks and vans.

(2) Medium heavy-duty compression-ignition engines and medium heavy-duty vocational vehicles and tractors.

(3) Heavy heavy-duty compression-ignition engines and heavy heavy-duty vocational vehicles and tractors.

Sleeper cab means a type of truck cab that has a compartment behind the driver's seat intended to be used by the driver for sleeping. This includes both cabs accessible from the driver's compartment and those accessible from outside the vehicle.

Small business manufacturer means a manufacturer meeting the criteria specified in 13 CFR 121.201. For manufacturers owned by a parent company, the employee and revenue limits apply to the total number employees and total revenue of the parent company and all its subsidiaries.

Spark-ignition (SI) means relating to a gasoline-fueled engine or any other type of engine with a spark plug (or other sparking device) and with operating characteristics significantly similar to the theoretical Otto combustion cycle. Spark-ignition engines usually use a throttle to regulate intake air flow to control power during normal operation. Note that some spark-ignition engines are subject to requirements that apply for compression-ignition engines as described in 40 CFR 1036.140.

Standard payload means the payload assumed for each vehicle, in tons, for modeling and calculating emission credits, as follows:

- (1) For vocational vehicles:
 - (i) 2.85 tons for light heavy-duty vehicles.
 - (ii) 5.6 tons for medium heavy-duty vehicles.
 - (iii) 7.5 tons for heavy heavy-duty vocational vehicles.
- (2) For tractors:
 - (i) 12.5 tons for Class 7.
 - (ii) 19 tons for Class 8.
 - (iii) 43 tons for heavy-haul tractors.
- (3) For trailers:
 - (i) 10 tons for short box vans.
 - (ii) 19 tons for other trailers.

Standard tractor has the meaning given in 40 CFR 1037.501.

Standard trailer has the meaning given in 40 CFR 1037.501.

Subconfiguration means a unique combination within a vehicle configuration of equivalent test weight, road-load horsepower, and any other operational characteristics or parameters that EPA determines may significantly affect CO₂ emissions within a vehicle configuration as defined in 40 CFR 600.002.

Tank trailer has the meaning given in 40 CFR 1037.801.

Test group means the multiple vehicle lines and model types that share critical emissions and fuel consumption related features and that are certified as a group by a common certificate of conformity issued by EPA and is used collectively with other test groups within an averaging set or regulatory subcategory and is used by NHTSA for determining the fleet average fuel consumption.

The agencies means the National Highway Traffic Safety Administration (NHTSA) and the Environmental Protection Agency (EPA) in this part.

Tire pressure monitoring system (TPMS) has the meaning given in section S3 of 49 CFR 571.138.

Tire rolling resistance level (TRRL) means a value with units of kg/metric ton that represents that rolling resistance of a tire configuration. TRRLs are used as inputs to the GEM model under 40 CFR 1037.520. Note that a

manufacturer may assign a value higher than a measured rolling resistance of a tire configuration.

Towing capacity in this part is equal to the resultant of subtracting the gross vehicle weight rating from the gross combined weight rating.

Trade means to exchange fuel consumption credits, either as a buyer or a seller.

U.S.-directed production volume means the number of vehicle units, subject to the requirements of this part, produced by a manufacturer for which the manufacturer has a reasonable assurance that sale was or will be made to ultimate purchasers in the United States.

Useful life has the meaning given in 40 CFR 1036.801 and 1037.801.

Vehicle configuration means a unique combination of vehicle hardware and calibration (related to measured or modeled emissions) within a vehicle family as specified in 40 CFR 1037.801. Vehicles with hardware or software differences, but that have no hardware or software differences related to measured or modeled emissions or fuel consumption can be included in the same vehicle configuration. Note that vehicles with hardware or software differences related to measured or modeled emissions or fuel consumption are considered to be different configurations even if they have the same GEM inputs and FEL. Vehicles within a vehicle configuration differ only with respect to normal production variability or factors unrelated to measured or modeled emissions and fuel consumption for EPA and NHTSA.

Vehicle family has the meaning given in 40 CFR 1037.230. Manufacturers designate families in accordance with EPA provisions and may not choose different families between the NHTSA and EPA programs. If a manufacturer is certifying vehicles within a vehicle family to more than one FEL, it must subdivide its greenhouse gas and fuel consumption vehicle families into subfamilies that include vehicles with identical FELs. Note that a manufacturer may add subfamilies at any time during the model year.

Vehicle service class has the same meaning for vehicles as specified in 40 CFR 1037.140. Fuel consumption standards and other provisions of this part apply to specific vehicle service classes for tractors and vocational vehicles as follows:

- (1) Phase 1 and Phase 2 tractors are divided based on GVWR into Class 7 tractors and Class 8 tractors. Where provisions apply to both tractors and vocational vehicles, Class 7 tractors are considered medium heavy-duty “MHD”

vehicles and Class 8 tractors are considered heavy heavy-duty “HHD” vehicles.

(2) Phase 1 vocational vehicles are divided based on GVWR. Light heavy-duty “LHD” vehicles includes Class 2b through Class 5 vehicles; medium heavy-duty “MHD” vehicles includes Class 6 and Class 7 vehicles; and heavy heavy-duty “HHD” vehicles includes Class 8 vehicles.

(3) Phase 2 vocational vehicles with spark-ignition engines are divided based on GVWR. Light heavy-duty “LHD” vehicles includes Class 2b through Class 5 vehicles, and medium heavy-duty “MHD” vehicles includes Class 6 through Class 8 vehicles.

(4) Phase 2 vocational vehicles with compression-ignition engines are divided as follows:

(i) Class 2b through Class 5 vehicles are considered light heavy-duty “LHD” vehicles.

(ii) Class 6 through 8 vehicles are considered heavy heavy-duty “HHD” vehicles if the installed engine’s primary intended service class is heavy heavy-duty (see 40 CFR 1036.140). All other Class 6 through Class 8 vehicles are considered medium heavy-duty “MHD” vehicles.

(5) In certain circumstances, manufacturers may certify vehicles to standards that apply for a different vehicle service class such as allowed in § 535.5(b)(6) and (c)(7). If manufacturers optionally certify vehicles to different standards, those vehicles are subject to all the regulatory requirements as if the standards were mandatory.

Vehicle subfamily or subfamily means a subset of a vehicle family including vehicles subject to the same FEL(s).

Vocational tractor has the meaning given in 40 CFR 1037.801.

Zero emissions vehicle means an electric vehicle or a fuel cell vehicle.

§ 535.5 Standards.

(a) *Heavy-duty pickup trucks and vans.* Each manufacturer’s fleet of heavy-duty pickup trucks and vans shall comply with the fuel consumption standards in this paragraph (a) expressed in gallons per 100 miles. Each vehicle must be manufactured to comply for its full useful life. For the Phase 1 program, if the manufacturer’s fleet includes conventional vehicles (gasoline, diesel and alternative fueled vehicles) and advanced technology vehicles (hybrids with powertrain designs that include energy storage systems, vehicles with waste heat recovery, electric vehicles and fuel cell vehicles), it may divide its fleet into two separate fleets each with its own separate fleet average fuel consumption

standard which the manufacturer must comply with the requirements of this paragraph (a). For Phase 2, manufacturers may calculate their fleet average fuel consumption standard for a conventional fleet and multiple advanced technology vehicle fleets. Advanced technology vehicle fleets should be separated into plug-in hybrid electric vehicles, electric vehicles and fuel cell vehicles. NHTSA standards correspond to the same requirements for EPA as specified in 40 CFR 86.1819–14.

(1) *Mandatory standards.* For model years 2016 and later, each manufacturer must comply with the fleet average standard derived from the unique subconfiguration target standards (or groups of subconfigurations approved by EPA in accordance with 40 CFR 86.1819) of the model types that make up the manufacturer's fleet in a given model year. Each subconfiguration has a unique attribute-based target standard, defined by each group of vehicles having the same payload, towing

capacity and whether the vehicles are equipped with a 2-wheel or 4-wheel drive configuration. Phase 1 target standards apply for model years 2016 through 2020. Phase 2 target standards apply for model year 2021 and afterwards.

(2) *Subconfiguration target standards.*

(i) Two alternatives exist for determining the subconfiguration target standards for Phase 1. For each alternative, separate standards exist for compression-ignition and spark-ignition vehicles:

(A) The first alternative allows manufacturers to determine a fixed fuel consumption standard that is constant over the model years; and

(B) The second alternative allows manufacturers to determine standards that are phased-in gradually each year.

(ii) Calculate the subconfiguration target standards as specified in this paragraph (a)(2)(ii), using the appropriate coefficients from Table 6 choosing between the alternatives in paragraph (a)(2)(i) of this section. For

electric or fuel cell heavy-duty vehicles, use compression-ignition vehicle coefficients “c” and “d” and for hybrid (including plug-in hybrid), dedicated and dual-fueled vehicles, use coefficients “c” and “d” appropriate for the engine type used. Round each standard to the nearest 0.001 gallons per 100 miles and specify all weights in pounds rounded to the nearest pound. Calculate the subconfiguration target standards using the following equation: Subconfiguration Target Standard (gallons per 100 miles) = [c × (WF)] + d

Where:

WF = Work Factor = [0.75 × (Payload Capacity + Xwd)] + [0.25 × Towing Capacity]

Xwd = 4wd Adjustment = 500 lbs if the vehicle group is equipped with 4wd and all-wheel drive, otherwise equals 0 lbs for 2wd.

Payload Capacity = GVWR (lbs)—Curb Weight (lbs) (for each vehicle group)

Towing Capacity = GCWR (lbs)—GVWR (lbs) (for each vehicle group)

TABLE 6—COEFFICIENTS FOR MANDATORY SUBCONFIGURATION TARGET STANDARDS

Model Year(s)	c	d

2025	0.0004366	3.364
2026	0.0004253	3.274
2027 and later	0.0004152	3.196

(3) *Fleet average fuel consumption standard.* (i) For the Phase 1 program, calculate each manufacturer's fleet average fuel consumption standard for a conventional fleet and a combined advanced technology fleet separately

based on the subconfiguration target standards specified in paragraph (a)(2) of this section, weighted to production volumes and averaged using the following equation combining all the applicable vehicles in a manufacturer's

U.S.-directed fleet (compression-ignition, spark-ignition and advanced technology vehicles) for a given model year, rounded to the nearest 0.001 gallons per 100 miles:

$$\text{Fleet Average Standard} = \frac{\sum [\text{Subconfiguration Target Standard}_i \times \text{Volume}_i]}{\sum [\text{Volume}_i]}$$

Where:

Subconfiguration Target Standard_i = fuel consumption standard for each group of vehicles with same payload, towing capacity and drive configuration (gallons per 100 miles).

Volume_i = production volume of each unique subconfiguration of a model type based upon payload, towing capacity and drive configuration.

(A) A manufacturer may group together subconfigurations that have the same test weight (ETW), GVWR, and GCWR. Calculate work factor and target value assuming a curb weight equal to two times ETW minus GVWR.

(B) A manufacturer may group together other subconfigurations if it uses the lowest target value calculated for any of the subconfigurations.

(ii) For Phase 1, manufacturers must select an alternative for

subconfiguration target standards at the same time they submit the model year 2016 pre-model year Report, specified in § 535.8. Once selected, the decision cannot be reversed and the manufacturer must continue to comply with the same alternative for subsequent model years.

(4) *Voluntary standards.* (i) Manufacturers may choose voluntarily to comply early with fuel consumption standards for model years 2013 through 2015, as determined in paragraphs (a)(4)(iii) and (iv) of this section, for example, in order to begin accumulating credits through over-compliance with the applicable standard. A manufacturer choosing early compliance must comply with all the vehicles and engines it manufactures in each regulatory category for a given model year.

(ii) A manufacturer must declare its intent to voluntarily comply with fuel consumption standards at the same time it submits a Pre-Model Report, prior to the compliance model year beginning as specified in § 535.8; and, once selected, the decision cannot be reversed and the manufacturer must continue to comply for each subsequent model year for all the vehicles and engines it manufactures in each regulatory category for a given model year.

(iii) Calculate separate subconfiguration target standards for compression-ignition and spark-ignition vehicles for model years 2013 through 2015 using the equation in paragraph (a)(2)(ii) of this section, substituting the appropriate values for the coefficients in the following table as appropriate:

TABLE 7—COEFFICIENTS FOR VOLUNTARY SUBCONFIGURATION TARGET STANDARDS

Model Year(s)	c	d
CI Vehicle Coefficients		
2013 and 14	0.0004695	3.615
2015	0.0004656	3.595
SI Vehicle Coefficients		
2013 and 14	0.0005424	4.175
2015	0.0005390	4.152

(iv) Calculate the fleet average fuel consumption standards for model years 2013 through 2015 using the equation in paragraph (a)(3) of this section.

(5) *Exclusion of vehicles not certified as complete vehicles.* The vehicle standards in paragraph (a) of this section do not apply for vehicles that are chassis-certified with respect to

EPA's criteria pollutant test procedure in 40 CFR part 86, subpart S. Any chassis-certified vehicles must comply with the vehicle standards and requirements of paragraph (b) of this section and the engine standards of paragraph (d) of this section for engines used in these vehicles. A vehicle manufacturer choosing to comply with

this paragraph and that is not the engine manufacturer is required to notify the engine manufacturers that their engines are subject to paragraph (d) of this section and that it intends to use their engines in excluded vehicles.

(6) *Optional certification under this section.* Manufacturers may certify certain complete or cab-complete

vehicles to the fuel consumption standards of this section. All vehicles optionally certified under this paragraph (6) are deemed to be subject to the fuel consumption standards of this section given the following conditions:

(i) For fuel consumption compliance, manufacturers may certify any complete or cab-complete spark-ignition vehicles above 14,000 pounds GVWR and at or below 26,000 pounds GVWR to the fuel consumption standards of this section.

(ii) Manufacturers may apply the provisions of this section to cab-complete vehicles based on a complete sister vehicle. In unusual circumstances, manufacturers may ask the agencies to apply these provisions to Class 2b or Class 3 incomplete vehicles that do not meet the definition of cab-complete.

(A) Except as specified in paragraph (a)(6)(iii) of this section, for purposes of this section, a complete sister vehicle is a complete vehicle of the same vehicle configuration as the cab-complete vehicle. A manufacturer may not apply the provisions of this paragraph (6) to any vehicle configuration that has a four-wheel rear axle if the complete sister vehicle has a two-wheel rear axle.

(B) Calculate the target value for the fleet-average fuel consumption standard under paragraph (a)(3) of this section based on the work factor value that applies for the complete sister vehicle.

(C) Test these cab-complete vehicles using the same equivalent test weight and other dynamometer settings that apply for the complete vehicle from which you used the work factor value (the complete sister vehicle). For fuel consumption certification, manufacturers may submit the test data from that complete sister vehicle instead of performing the test on the cab-complete vehicle.

(D) Manufacturers are not required to produce the complete sister vehicle for sale to use the provisions of this paragraph (a)(6)(ii). This means the complete sister vehicle may be a carryover vehicle from a prior model year or a vehicle created solely for the purpose of testing.

(iii) For fuel consumption purposes, if a cab-complete vehicle is not of the same vehicle configuration as a complete sister vehicle due only to certain factors unrelated to coastdown performance, manufacturers may use the road-load coefficients from the complete sister vehicle for certification testing of the cab-complete vehicle, but it may not use fuel consumption data from the complete sister vehicle for certifying the cab-complete vehicle.

(7) *Loose engines.* For model year 2023 and earlier spark-ignition engines

with identical hardware compared with engines used in vehicles certified to the standards of this section, where such engines are sold as loose engines or as engines installed in incomplete vehicles that are not cab-complete vehicles.

Manufacturers may certify such engines to the standards of this section, subject to the following provisions:

(i) For 2020 and earlier model years, the maximum allowable U.S.-directed production volume of engines manufacturers may sell under this paragraph (7) in any given model year is ten percent of the total U.S.-directed production volume of engines of that design that the manufacturer produces for heavy-duty applications for that model year, including engines it produces for complete vehicles, cab-complete vehicles, and other incomplete vehicles. The total number of engines a manufacturer may certify under this paragraph (7), of all engine designs, may not exceed 15,000 in any model year. Engines produced in excess of either of these limits are not covered by your certificate. For example, a manufacturer produces 80,000 complete model year 2017 Class 2b pickup trucks with a certain engine and 10,000 incomplete model year 2017 Class 3 vehicles with that same engine, and the manufacturer did not apply the provisions of this paragraph (a)(7) to any other engine designs, it may produce up to 10,000 engines of that design for sale as loose engines under this paragraph (a)(7). If a manufacturer produced 11,000 engines of that design for sale as loose engines, the last 1,000 of them that it produced in that model year 2017 would be considered uncertified.

(ii) For model years 2021 through 2023, the U.S.-directed production volume of engines manufacturers sell under this paragraph (a)(7) in any given model year may not exceed 10,000 units. This paragraph (a)(7) does not apply for engines certified to the standards of paragraph (d) of this section and 40 CFR 1036.108.

(iii) Vehicles using engines certified under this paragraph (a)(7) are subject to the fuel consumption and emission standards of paragraph (b) of this section and 40 CFR 1037.105 and engine standards in 40 CFR 1036.150(j).

(iv) For certification purposes, engines are deemed to have a fuel consumption target values and test result equal to the fuel consumption target value and test result for the complete vehicle in the applicable test group with the highest equivalent test weight, except as specified in paragraph (a)(7)(iv)(B) of this section.

Manufacturers use these values to calculate target values and the fleet-

average fuel consumption rate. Where there are multiple complete vehicles with the same highest equivalent test weight, select the fuel consumption target value and test result as follows:

(A) If one or more of the fuel consumption test results exceed the applicable target value, use the fuel consumption target value and test result of the vehicle that exceeds its target value by the greatest amount.

(B) If none of the fuel consumption test results exceed the applicable target value, select the highest target value and set the test result equal to it. This means that the manufacturer may not generate fuel consumption credits from vehicles certified under this paragraph (a)(7).

(8) *Alternative fuel vehicle conversions.* Alternative fuel vehicle conversions may demonstrate compliance with the standards of this part or other alternative compliance approaches allowed by EPA in 40 CFR 85.525.

(9) *Advanced, innovative and off-cycle technologies.* For vehicles subject to Phase 1 standards, manufacturers may generate separate credit allowances for advanced and innovative technologies as specified in § 535.7(f)(1) and (2). For vehicles subject to Phase 2 standards, manufacturers may generate separate credits allowance for off-cycle technologies in accordance with § 535.7(f)(2). Separate credit allowances for advanced technology vehicles cannot be generated; instead manufacturers may use the credit multipliers specified in § 535.7(f)(1)(iv) through model year 2026.

(10) *Useful life.* The following useful life values apply for the standards of this section:

(i) 120,000 miles or 10 years, whichever comes first, for Class 2b through Class 3 heavy-duty pickup trucks and vans certified to Phase 1 standards.

(ii) 150,000 miles or 15 years, whichever comes first, for Class 2b through Class 3 heavy-duty pickup trucks and vans certified to Phase 2 standards.

(iii) For Phase 1 credits that you calculate based on a useful life of 120,000 miles, multiply any banked credits that you carry forward for use into the Phase 2 program by 1.25. For Phase 1 credit deficits that you generate based on a useful life of 120,000 miles multiply the credit deficit by 1.25 if offsetting the shortfall with Phase 2 credits.

(11) *Compliance with standards.* A manufacturer complies with the standards of this part as described in § 535.10.

(b) *Heavy-duty vocational vehicles.* Each manufacturer building complete or incomplete heavy-duty vocational vehicles shall comply with the fuel consumption standards in this paragraph (b) expressed in gallons per 1000 ton-miles. Engines used in heavy-duty vocational vehicles shall comply with the standards in paragraph (d) of this section. Each vehicle must be manufactured to comply for its full useful life. Standards apply to the vehicle subfamilies based upon the vehicle service classes within each of the vocational vehicle regulatory subcategories in accordance with § 535.4 and based upon the applicable modeling and testing specified in § 535.6. Determine the duty cycles that apply to vocational vehicles according to 40 CFR 1037.140 and 1037.150(z).

(1) *Mandatory standards.* Heavy-duty vocational vehicle subfamilies produced for Phase 1 must comply with the fuel consumption standards in paragraph (b)(3) of this section. For Phase 2, each vehicle manufacturer of heavy-duty vocational vehicle subfamilies must comply with the fuel consumption standards in paragraph (b)(4) of this section.

(i) For model years 2016 to 2020, the heavy-duty vocational vehicle category is subdivided by GVWR into three regulatory subcategories as defined in

§ 535.4, each with its own assigned standard.

(ii) For model years 2021 and later, the heavy-duty vocational vehicle category is subdivided into 15 regulatory subcategories depending upon whether vehicles are equipped with a compression or spark-ignition engine, as defined in § 535.4. Standards also differ based upon vehicle service class and intended vehicle duty cycles. See 40 CFR 1037.140 and 1037.150(z).

(iii) For purposes of certifying vehicles to fuel consumption standards, manufacturers must divide their product lines in each regulatory subcategory into vehicle families that have similar emissions and fuel consumption features, as specified by EPA in 40 CFR 1037.230. These families will be subject to the applicable standards. Each vehicle family is limited to a single model year.

(A) Vocational vehicles including custom chassis vehicles must use qualified automatic tire inflation systems or tire pressure monitoring systems for wheels on all axles.

(B) Tire pressure monitoring systems must use low pressure warning and malfunction telltales in clear view of the driver as specified in S4.3 and S4.4 of 49 CFR 571.138.

(2) *Voluntary compliance.* (i) For model years 2013 through 2015, a

manufacturer may choose voluntarily to comply early with the fuel consumption standards provided in paragraph (b)(3) of this section. For example, a manufacturer may choose to comply early in order to begin accumulating credits through over-compliance with the applicable standards. A manufacturer choosing early compliance must comply with all the vehicles and engines it manufactures in each regulatory category for a given model year.

(ii) A manufacturer must declare its intent to voluntarily comply with fuel consumption standards and identify its plans to comply before it submits its first application for a certificate of conformity for the respective model year as specified in § 535.8; and, once selected, the decision cannot be reversed and the manufacturer must continue to comply for each subsequent model year for all the vehicles and engines it manufactures in each regulatory category for a given model year.

(3) *Regulatory subcategory standards for model years 2013 to 2020.* The mandatory and voluntary fuel consumption standards for heavy-duty vocational vehicles are given in the following table:

TABLE 8—PHASE 1 VOCATIONAL VEHICLE FUEL CONSUMPTION STANDARDS
[Gallons per 1000 ton-miles]

Regulatory subcategories	Vocational LHD vehicles	Vocational MHD vehicles	Vocational HHD vehicles
Model Years 2013 to 2016 Voluntary Standards			
Standard	38.1139	22.9862	22.2004
Model Years 2017 to 2020 Mandatory Standards			
Standard	36.6405	22.1022	21.8075

(4) *Regulatory subcategory standards for model years 2021 and later.* The mandatory fuel consumption standards

for heavy-duty vocational vehicles are given in the following table:

TABLE 9—PHASE 2 VOCATIONAL VEHICLE FUEL CONSUMPTION STANDARDS
[Gallons per 1,000 ton-miles]

Duty cycle	LHD Vocational vehicles	MHD Vocational vehicles	Vocational HHD vehicles

Multi-Purpose	41.8589	30.1564	NA
Regional	35.8951	27.7934	NA

(5) *Subfamily standards.* Manufacturers may specify a family emission limit (FEL) in terms of fuel consumption for each vehicle subfamily. The FEL may not be less than the result of fuel consumption modeling from 40 CFR 1037.520. The FELs is the fuel consumption standards for the vehicle subfamily instead of the standards specified in paragraph (b)(3) and (4) of this section and can be used for calculating fuel consumption credits in accordance with § 535.7.

(6) *Alternate standards for custom chassis vehicles for model years 2021 and later.* Manufacturers may elect to certify certain vocational vehicles to the alternate standards for custom chassis vehicles specified in this paragraph

(b)(6) instead of the standards specified in paragraph (b)(4) of this section. Note that, although these standards were established for custom chassis vehicles, manufacturers may apply these provisions to any qualifying vehicle even though these standards were established for custom chassis vehicles. For example, large diversified vehicle manufacturers may certify vehicles to the refuse hauler standards of this section as long as the manufacturer ensures that those vehicles qualify as refuse haulers when placed into service. GEM simulates vehicle operation for each type of vehicle based on an assigned vehicle service class, independent of the vehicle's actual characteristics, as shown in Table 10 of

this section; however, standards apply for the vehicle's useful life based on its actual characteristics as specified in paragraph (b)(10) of this section. Vehicles certified to these alternative standards must use engines certified to requirements under paragraph (d) of this section and 40 CFR part 1036 for the appropriate model year, except that motor homes and emergency vehicles may use engines certified with the loose-engine provisions of paragraph (a)(7) of this section and 40 CFR 1037.150(m). This also applies for vehicles meeting standards under paragraphs (b)(6)(iv) through (vi) of this section. The fuel consumption standards for custom chassis vehicles are given in the following table:

TABLE 10—PHASE 2 CUSTOM CHASSIS FUEL CONSUMPTION STANDARDS
[Gallon per 1,000 ton-mile]

Vehicle type ¹	Assigned vehicle service class	MY 2021	MY 2027
Coach Bus	HHD Vehicle	20.6287	20.1375
Motor Home	MDH Vehicle	22.3969	22.2004
School Bus	MHD Vehicle	28.5855	26.6208
Other bus	HHD Vehicle	29.4695	28.0943
Refuse hauler	HHD Vehicle	30.7466	29.2731
Concrete mixer	HHD Vehicle	31.3360	31.0413
Mixed-use vehicle	HHD Vehicle	31.3360	31.0413
Emergency Vehicle	HHD Vehicle	31.8271	31.3360

¹ Vehicle types are generally defined in § 535.3. "Other bus" includes any bus that is not a school bus or a coach bus. A "mixed-use vehicle" is one that meets at least one of the criteria specified in 40 CFR 1037.631(a)(1) or at least one of the criteria in 40 CFR 1037.631(a)(2), but not both.

(i) Manufacturers may generate or use fuel consumption credits for averaging to demonstrate compliance with the alternative standards as described in § 535.7(c). This requires that manufacturers specify a Family Emission Limit (FEL) for fuel consumption for each vehicle subfamily. The FEL may not be less than the result of emission modeling as described in this paragraph (b). These FELs serve as the fuel consumption standards for the vehicle subfamily instead of the standards specified in this paragraph (b)(6). Manufacturers may only use fuel consumption credits for vehicles certified to the optional standards in this paragraph (b)(6) as specified in § 535.7(c)(6) through (8) and you may not bank or trade fuel consumption credits from any vehicles certified under this paragraph (b)(6).

(ii) For purposes of this paragraph (b)(6), each separate vehicle type identified in Table 10 of this section is in a separate averaging set.

(iii) For purposes of emission and fuel consumption modeling under 40 CFR 1037.520, consider motor homes and coach buses to be subject to the Regional duty cycle, and consider all other vehicles to be subject to the Urban duty cycle.

(iv) Emergency vehicles are deemed to comply with the standards of this paragraph (6) if manufacturers use tires with TRRL at or below 8.4 kg/ton (8.7 g/ton for model years 2021 through 2026).

(v) Concrete mixers are deemed to comply with the standards of this paragraph (6) if manufacturers use tires with TRRL at or below 7.1 kg/ton (7.6 g/ton for model years 2021 through 2026).

(vi) Motor homes are deemed to comply with the standards of this paragraph (b)(6) if manufacturers use the following technologies:

(A) Tires with TRRL at or below 6.0 kg/ton (6.7 g/ton for model years 2021 through 2026).

(B) Automatic tire inflation systems or tire pressure monitoring systems with wheels on all axles.

(C) Tire pressure monitoring systems must use low pressure warning and malfunction telltales in clear view of the driver as specified in S4.3 and S4.4 of 49 CFR 571.138.

(vii) Small business manufacturers using the alternative standards for custom chassis vehicles under this paragraph (b)(6) may use fuel consumption credits subject to the unique provisions in § 535.7(a)(9).

(7) *Advanced, innovative and off-cycle technologies.* For vocational vehicles subfamilies subject to Phase 1

standards, manufacturers must create separate vehicle subfamilies for vehicles that contain advanced or innovative technologies and group those vehicles together in a vehicle subfamily if they use the same advanced or innovative technologies. Manufacturers may generate separate credit allowances for advanced and innovative technologies as specified in § 535.7(f)(1) and (2). For vehicles subfamilies subject to Phase 2 standards, manufacturers may generate separate credit allowances for off-cycle technologies in accordance with § 535.7(f)(2). Separate credit allowances for advanced technology vehicles cannot be generated but instead manufacturers may use the credit multipliers specified in § 535.7(f)(1)(iv) through model year 2026.

(8) *Certifying across service classes.* A manufacturer may optionally certify a vocational vehicle subfamilies to the standards and useful life applicable to a heavier vehicle service class (such as MHD vocational vehicles instead of LHD vocational vehicles). Provisions related to generating fuel consumption credits apply as follows:

(i) If a manufacturer certifies all its vehicles from a given vehicle service class in a given model year to the standards and useful life that applies for a heavier vehicle service class, it may generate credits as appropriate for the heavier service class.

(ii) Class 8 hybrid vehicles with light or medium heavy-duty engines may be certified to compression-ignition standards for the Heavy HDV service class. A manufacturer may generate and use credits as allowed for the Heavy HDV service class.

(iii) Except as specified in paragraphs (b)(8)(i) and (ii) of this section, a manufacturer may not generate credits with the vehicle. If you include lighter vehicles in a subfamily of heavier vehicles with an FEL below the standard, exclude the production volume of lighter vehicles from the credit calculation. Conversely, if a manufacturer includes lighter vehicles in a subfamily with an FEL above the standard, it must include the production volume of lighter vehicles in the credit calculation.

(9) *Off-road exemptions.* This section provides an exemption for heavy-duty vocational vehicle subfamilies, including vocational tractors that are intended to be used extensively in off-road environments such as forests, oil fields, and construction sites from the fuel consumption standards in this paragraph (b). Vehicle exempted by this part do not comply with vehicle standards in this paragraph (b), but the engines in these vehicles must meet the

engine requirements of paragraph (d) of this section. Note that manufacturers may not include these exempted vehicles in any credit calculations under this part.

(i) *Qualifying criteria.* Vocational vehicles intended for off-road use are exempt without request, subject to the provisions of this section, if they are primarily designed to perform work off-road (such as in oil fields, mining, forests, or construction sites), and they meet at least one of the criteria of paragraph (b)(9)(i)(A) of this section and at least one of the criteria of paragraph (b)(9)(i)(B) of this section. See paragraph (b)(6) of this section for alternate standards that apply for vehicles meeting only one of these sets of criteria.

(A) The vehicle must have affixed components designed to work inherently in an off-road environment (such as hazardous material equipment or off-road drill equipment) or be designed to operate at low speeds such that it is unsuitable for normal highway operation.

(B) The vehicle must meet one of the following criteria:

(1) Have an axle that has a gross axle weight rating (GAWR) at or above 29,000 pounds.

(2) Have a speed attainable in 2.0 miles of not more than 33 mi/hr.

(3) Have a speed attainable in 2.0 miles of not more than 45 mi/hr, an unloaded vehicle weight that is not less than 95 percent of its gross vehicle weight rating, and no capacity to carry occupants other than the driver and operating crew.

(4) Have a maximum speed at or below 54 mi/hr. A manufacturer may consider the vehicle to be appropriately speed-limited if engine speed at 54 mi/hr is at or above 95 percent of the engine's maximum test speed in the highest available gear. A manufacturer may alternatively limit vehicle speed by programming the engine or vehicle's electronic control module in a way that is tamper-resistant.

(ii) *Tractors.* The provisions of this section may apply for tractors only if each tractor qualifies as a vocational tractor under paragraph (c)(9) of this section or is granted approval for the exemption as specified in paragraph (b)(9)(iii) of this section.

(iii) *Preliminary approval before certification.* If a manufacturers has unusual circumstances where it may be questionable whether its vehicles qualify for the off-road exemption of this part, the manufacturer may send the agencies information before finishing its application for certification (see 40 CFR 1037.205) for the applicable vehicles

and ask for a preliminary informal approval. The agencies will review the request and make an appropriate determination in accordance with 40 CFR 1037.210. The agencies will generally not reverse a decision where they have given a manufacturer preliminary approval, unless the agencies find new information supporting a different decision. However, the agencies will normally not grant relief in cases where the vehicle manufacturer has credits or can otherwise comply with the applicable standards.

(iv) *Recordkeeping and reporting.* (A) A manufacturers must keep records to document that its exempted vehicle configurations meet all applicable requirements of this section. Keep these records for at least eight years after you stop producing the exempted vehicle model. The agencies may review these records at any time.

(B) A manufacturers must also keep records of the individual exempted vehicles you produce, including the vehicle identification number and a description of the vehicle configuration.

(C) Within 90 days after the end of each model year, manufacturers must send to EPA a report as specified in § 535.8(g)(7) and EPA will make the report available to NHTSA.

(v) *Compliance.* (A) Manufacturers producing vehicles meeting the off-road exemption criteria in paragraph (b)(9)(i) of this section or that are granted a preliminary approval comply with the standards of this part.

(B) In situations where a manufacturer would normally ask for a preliminary approval subject to paragraph (b)(9)(iii) of this section but introduces its vehicle into U.S. commerce without seeking approval first from the agencies, those vehicles violate compliance with the fuel consumption standards of this part and the EPA provisions under 40 CFR 1068.101(a)(1).

(C) If at any time, the agencies find new information that contradicts a manufacturer's use of the off-road exemption of this part, the manufacturers vehicles will be determined to be non-compliant with the regulations of this part and the manufacturer may be liable for civil penalties.

(10) *Useful life.* The following useful life values apply for the standards of this section:

(i) 110,000 miles or 10 years, whichever comes first, for vocational LHD vehicles certified to Phase 1 standards.

(ii) 150,000 miles or 15 years, whichever comes first, for vocational LHD vehicles certified to Phase 2 standards.

(iii) 185,000 miles or 10 years, whichever comes first, for vocational MHD vehicles for Phase 1 and 2.

(iv) 435,000 miles or 10 years, whichever comes first, for vocational HHD vehicles for Phase 1 and 2.

(v) For Phase 1 credits calculated based on a useful life of 110,000 miles, multiply any banked credits carried forward for use into the Phase 2 program by 1.36. For Phase 1 credit deficits generated based on a useful life of 110,000 miles multiply the credit deficit by 1.36, if offsetting the shortfall with Phase 2 credits.

(11) *Recreational vehicles.* Recreational vehicles manufactured after model year 2020 must comply with the fuel consumption standards of this section. Manufacturers producing these vehicles may also certify to fuel consumption standards from 2014 through model year 2020.

Manufacturers may earn credits retroactively for early compliance with fuel consumption standards. Once selected, a manufacturer cannot reverse the decision and the manufacturer must continue to comply for each subsequent model year for all the vehicles it manufacturers in each regulatory subcategory for a given model year.

(12) *Loose engines.* Manufacturers may certify certain spark-ignition engines along with chassis-certified heavy-duty vehicles where there are identical engines used in those vehicles as described in 40 CFR 86.1819(k)(8) and 40 CFR 1037.150(m). Vehicles in which those engines are installed are subject to standards under this part.

(13) *Compliance with Standards.* A manufacturer complies with the standards of this part as described in § 535.10.

(c) *Truck tractors.* Each manufacturer building truck tractors, except vocational tractors or vehicle constructed in accordance with § 571.7(e), with a GVWR above 26,000 pounds shall comply with the fuel consumption standards in this paragraph (c) expressed in gallons per 1000 ton-miles. Engines used in heavy-duty truck tractors vehicles shall comply with the standards in paragraph (d) of this section. Each vehicle must be manufactured to comply for its full useful life. Standards apply to the vehicle subfamilies within each of the tractor vehicle regulatory subcategories in accordance with § 535.4 and 40 CFR 1037.230 and based upon the applicable

modeling and testing specified in § 535.6. Determine the vehicles in each regulatory subcategory in accordance with 40 CFR 1037.140.

(1) *Mandatory standards.* For model years 2016 and later, each manufacturer's truck tractor subfamilies must comply with the fuel consumption standards in paragraph (c)(3) of this section.

(i) Based on the roof height and the design of the cab, the truck tractor category is divided into subcategories as described in § 535.4. The standards that apply to each regulatory subcategory are shown in paragraphs (c)(2) and (3) of this section, each with its own assigned standard.

(ii) For purposes of certifying vehicles to fuel consumption standards, manufacturers must divide their product lines in each regulatory subcategory into vehicles subfamilies that have similar emissions and fuel consumption features, as specified by EPA in 40 CFR 1037.230, and these subfamilies will be subject to the applicable standards. Each vehicle subfamily is limited to a single model year.

(iii) Standards for truck tractor engines are given in paragraph (d) of this section.

(2) *Voluntary compliance.* (i) For model years 2013 through 2015, a manufacturer may choose voluntarily to comply early with the fuel consumption standards provided in paragraph (c)(3) of this section. For example, a manufacturer may choose to comply early in order to begin accumulating credits through over-compliance with the applicable standards. A manufacturer choosing early compliance must comply with all the vehicles and engines it manufacturers in each regulatory category for a given model year.

(ii) A manufacturer must declare its intent to voluntarily comply with fuel consumption standards and identify its plans to comply before it submits its first application for a certificate of conformity for the respective model year as specified in § 535.8; and, once selected, the decision cannot be reversed and the manufacturer must continue to comply for each subsequent model year for all the vehicles and engines it manufacturers in each regulatory category for a given model year.

(3) *Regulatory subcategory standards.* The fuel consumption standards for truck tractors, except for vocational tractors, are given in the following table:

TABLE 11—TRUCK TRACTOR FUEL CONSUMPTION STANDARDS
[Gallons per 1,000 ton-miles]

Regulatory subcategories	Day cab		Sleeper cab	Heavy-Haul
	Class 7	Class 8	Class 8	
Phase 1—Model Years 2013 to 2015 Voluntary Standards				
Low Roof	10.5108	7.9568	6.6798	
Mid Roof	11.6896	8.6444	7.4656	
High Roof	12.1807	9.0373	7.3674	
Phase 1—Model Year 2016 Mandatory Standard				
Low Roof	10.5108	7.9568	6.6798	NA
Mid Roof	11.6896	8.6444	7.4656	
High Roof	12.1807	9.0373	7.3674	
Phase 1—Model Years 2017 to 2020 Mandatory Standards				
Low Roof	10.2161	7.8585	6.4833	NA
Mid Roof	11.2967	8.4479	7.1709	
High Roof	11.7878	8.7426	7.0727	
Phase 2—Model Years 2021 to 2023 Mandatory Standards				
Low Roof	10.36346	7.90766	7.10216	5.14735
Mid Roof	11.11984	8.38900	7.66208	
High Roof	11.14931	8.40864	7.43615	
Phase 2—Model Years 2024 to 2026 Mandatory Standards				
Low Roof	9.80354	7.48527	6.67976	4.93124
Mid Roof	10.52063	7.94695	7.22004	
High Roof	10.47151	7.89784	6.94499	
Phase 2—Model Years 2027 and later Mandatory Standards				
Low Roof	9.44990	7.21022	6.29666	4.74460
Mid Roof	10.15717	7.66208	6.83694	
High Roof	9.82318	7.43615	6.31631	

(4) *Subfamily standards.* Manufacturers may generate or use fuel consumption credits for averaging, banking, and trading as described in § 535.7(c). This requires that manufacturers calculate a credit quantity if they specify a Family Emission Limit (FEL) that is different

than the standard specified in this section. The FEL may not be less than the result of emission and fuel consumption modeling from 40 CFR 1037.520. These FELs serve as the emission standards for the specific vehicle subfamily instead of the

standards specified in paragraph (2) of this section.

(5) *Alternate standards for tractors at or above 120,000 pounds GCWR.* Manufacturers may certify tractors at or above 120,000 pounds GCWR to the following fuel consumption standards in the following table:

TABLE 12—ALTERNATE FUEL CONSUMPTION STANDARDS FOR TRACTORS ABOVE 120,000 POUNDS GCWR FOR 2021 MY AND LATER FUEL CONSUMPTION
[Gallons per 1,000 ton-miles]

Low roof day cab	Mid roof day cab	High roof day cab	Low roof sleeper cab	Mid roof sleeper cab	High roof sleeper cab
3.59528	3.82122	3.84086	3.26130	3.52652	3.43811

(6) *Advanced, innovative and off-cycle technologies.* For tractors subject to Phase 1 standards, manufacturers must create separate vehicle subfamilies for vehicles that contain advanced or innovative technologies and group those vehicles together in a vehicle subfamilies if they use the same advanced or innovative technologies.

Manufacturers may generate separate credit allowances for advanced and innovative technologies as specified in § 535.7(f)(1) and (2). For vehicles subject to Phase 2 standards, manufacturers may generate separate credits allowance for off-cycle technologies in accordance with § 535.7(f)(2). Separate credit allowances for advanced technology

vehicles cannot be generated but instead manufacturers may use the credit multipliers specified in § 535.7(f)(1)(iv) through model year 2026.

(7) *Certifying across service classes.* Manufacturers may certify Class 7 tractors to Class 8 tractors standards as follows:

(i) A manufacturer may optionally certify 4x2 tractors with heavy-duty engines to the standards and useful life for Class 8 tractors, with no restriction on generating or using fuel consumption credits within the Class 8 averaging set.

(ii) A manufacturer may optionally certify a Class 7 tractor to the standards and useful life applicable to Class 8 tractors. Credit provisions apply as follows:

(A) If a manufacturer certifies all of its Class 7 tractors to Class 8 standards, it may use these Heavy HDV credits without restriction.

(B) This paragraph (c)(7)(ii)(B) applies if a manufacturer certifies some Class 7 tractors to Class 8 standards under this paragraph (c)(7)(ii) but not all of them. If a manufacturer includes Class 7 tractors in a subfamily of Class 8 tractors with an FEL below the standard, exclude the production volume of Class 7 tractors from the credit calculation. Conversely, if a manufacturer includes Class 7 tractors in a subfamily of Class 8 tractors with an FEL above the standard, it must include the production volume of Class 7 tractors in the credit calculation.

(8) *Expanded families.* Manufacturers may combine dissimilar vehicles into a single vehicle subfamilies for applying standards and for testing in special circumstances as follows:

(i) For a Phase 1 vehicle model that straddles a roof-height, cab type, or GVWR division, manufacturers can include all the vehicles in the same vehicle family if it certifies the vehicle family to the more stringent standard. For roof height, the manufacturer must certify to the taller roof standard. For cab-type and GVWR, the manufacturers must certify to the numerically lower standard.

(ii) For a Phase 2 vehicle model that includes a range of GVWR values that straddle weight classes, manufacturers may include all the vehicles in the same vehicle family if it certifies the vehicle family to the numerically lower fuel consumption standard from the affected service classes. Vehicles that are optionally certified to a more stringent standard under this paragraph are subject to useful-life and all other provisions corresponding to the weight class with the numerically lower fuel consumption standard. For a Phase 2 tractor model that includes a range of roof heights that straddle subcategories, a manufacturer may include all the vehicles in the same vehicle family if it certifies the vehicle family to the appropriate subcategory as follows:

(A) A manufacturer may certify mid-roof tractors as high-roof tractors, but it

may not certify high-roof tractors as mid-roof tractors.

(B) For tractor families straddling the low-roof/mid-roof division, a manufacturer may certify the family based on the primary roof-height as long as no more than 10 percent of the tractors are certified to the otherwise inapplicable subcategory. For example, if 95 percent of the tractors in the family are less than 120 inches tall, and the other 5 percent are 122 inches tall, a manufacturer may certify the tractors as a single family in the low-roof subcategory.

(C) Determine the appropriate aerodynamic bin number based on the actual roof height if the C_dA value is measured. However, use the GEM input for the bin based on the standards to which the manufacturer certifies. For example, of a manufacturer certifies as mid roof tractors some low-roof tractors with a measured C_dA value of 4.2 m², it qualifies as Bin IV; and must input into GEM the mid-roof Bin IV value of 5.85 m².

(9) *Vocational tractors.* Tractors meeting the definition of vocational tractors in 49 CFR 523.2 must comply with requirements for heavy-duty vocational vehicles specified in paragraphs (b) and (d) of this section. For Phase 1, Class 7 and Class 8 tractors certified or exempted as vocational tractors are limited in production to no more than 21,000 vehicles in any three consecutive model years. If a manufacturer is determined as not applying this allowance in good faith by EPA in its applications for certification in accordance with 40 CFR 1037.205 and 1037.610, a manufacturer must comply with the tractor fuel consumption standards in paragraph (c)(3) of this section. No production limit applies for vocational tractors subject to Phase 2 standards.

(10) *Small business manufacturers converting to mid roof or high roof configurations.* Small manufacturers are to allowed convert low and mid roof tractors to high roof configurations without recertification, provided it is for the purpose of building a custom sleeper tractor or conversion to a natural gas tractor as specified in 40 CFR 1037.150(r).

(11) *Useful life.* The following useful life values apply for the standards of this section:

(i) 185,000 miles or 10 years, whichever comes first, for vehicles at or below 33,000 pounds GVWR.

(ii) 435,000 miles or 10 years, whichever comes first, for vehicles above 33,000 pounds GVWR.

(12) *Conversion to high-roof configurations.* Secondary vehicle

manufacturers that qualify as small manufacturers may convert low- and mid-roof tractors to high-roof configurations without recertification for the purpose of building a custom sleeper tractor or converting it to run on natural gas, as follows:

(i) The original low- or mid-roof tractor must be covered by a valid certificate of conformity by EPA.

(ii) The modifications may not increase the frontal area of the tractor beyond the frontal area of the equivalent high-roof tractor with the corresponding standard trailer. If a manufacturer cannot use the original manufacturer's roof fairing for the high-roof tractor, use good engineering judgment to achieve similar or better aerodynamic performance.

(iii) The agencies may require that these manufacturers submit annual production reports as described in § 535.8 and 40 CFR 1037.250 indicating the original roof height for requalified vehicles.

(13) *Compliance with standards.* A manufacturer complies with the standards of this part as described in § 535.10.

(d) *Heavy-duty engines.* Each manufacturer of heavy-duty engines shall comply with the fuel consumption standards in this paragraph (d) of this section expressed in gallons per 100 horsepower-hour. Each engine must be manufactured to comply for its full useful life, expressed in service miles, operating hours, or calendar years, whatever comes first. The provisions of this part apply to all new 2014 model year and later heavy-duty engines fueled by conventional and alternative fuels and manufactured for use in heavy-duty tractors or vocational vehicles. Standards apply to the engine families based upon the primary intended service classes within each of the engine regulatory subcategories as described in § 535.4 and based upon the applicable modeling and testing specified in § 535.6.

(1) *Mandatory standards.* Manufacturers of heavy-duty engine families shall comply with the mandatory fuel consumption standards in paragraphs (d)(3) through (6) of this section for model years 2017 and later for compression-ignition engines and for model years 2016 and later for spark-ignition engines.

(i) The heavy-duty engine regulatory category is divided into six regulatory subcategories, five compression-ignition subcategories and one spark-ignition subcategory, as shown in Table 14 of this section.

(ii) Separate standards exist for engine families manufactured for use in heavy-

duty vocational vehicles and in truck tractors.

(iii) For purposes of certifying engines to fuel consumption standards, manufacturers must divide their product lines in each regulatory subcategory into engine families. Fuel consumption standards apply each model year to the same engine families used to comply with EPA standards in 40 CFR 1036.108 and 40 CFR 1037.230. An engine family is designated under the EPA program based upon testing specified in 40 CFR part 1036, subpart F, and the engine family's primary intended service class. Each engine family manufactured for use in a heavy-duty tractor or vocational vehicle must be certified to the primary intended service class that it is designed for in

accordance with 40 CFR 1036.108 and 1036.140.

(2) *Voluntary compliance.* (i) For model years 2013 through 2016 for compression-ignition engine families, and for model year 2015 for spark-ignition engine families, a manufacturer may choose voluntarily to comply with the fuel consumption standards provided in paragraphs (d)(3) through (5) of this section. For example, a manufacturer may choose to comply early in order to begin accumulating credits through over-compliance with the applicable standards. A manufacturer choosing early compliance must comply with all the vehicles and engines it manufactures in each regulatory category for a given model year except in model year 2013 the manufacturer may comply with

individual engine families as specified in 40 CFR 1036.150(a)(2).

(ii) A manufacturer must declare its intent to voluntarily comply with fuel consumption standards and identify its plans to comply before it submits its first application for a certificate of conformity for the respective model year as specified in § 535.8; and, once selected, the decision cannot be reversed and the manufacturer must continue to comply for each subsequent model year for all the vehicles and engines it manufactures in each regulatory category for a given model year.

(3) *Regulatory subcategory standards.* The primary fuel consumption standards for heavy-duty engine families are given in the following table:

TABLE 13—PRIMARY HEAVY-DUTY ENGINE FUEL CONSUMPTION STANDARDS

[Gallons per 100 hp-hr]

Regulatory subcategory	CI LHD engines and all other engines	CI MHD engines and all other engines		HHD CI engines and all other engines		SI engines
Application		Vocational	Vocational	Tractor	Vocational	Tractor
Phase 1—Voluntary Standards						
2015	7.0552
2013 to 2016	5.8939	5.8939	4.9312	5.5697	4.666	
Phase 1—Mandatory Standards						
2016	7.0552
2017 to 2020	5.6582	5.6582	4.6660	5.4519	4.4401	7.0552
Phase 2—Mandatory Standards						
2021 to 2023	5.5305	5.3536	4.6464	5.0393	4.3910	7.0552
2024 to 2026	5.4519	5.2849	4.5285	4.9705	4.2829	7.0552
2027 and later	5.4224	5.2554	4.4892	4.9411	4.2436	7.0552

(4) *Alternate subcategory standards.* The alternative fuel consumption standards for heavy-duty compression-ignition engine families are as follows:

(i) Manufacturers entering the voluntary program in model years 2014 through 2016, may choose to certify compression-ignition engine families unable to meet standards provided in paragraph (d)(3) of this section to the alternative fuel consumption standards of this paragraph (d)(4).

(ii) Manufacturers may not certify engines to these alternate standards if they are part of an averaging set in which they carry a balance of banked credits. For purposes of this section,

manufacturers are deemed to carry credits in an averaging set if they carry credits from advance technology that are allowed to be used in that averaging set in accordance with § 535.7(d)(12).

(iii) The emission standards of this section are determined as specified by EPA in 40 CFR 1036.620(a) through (c) and should be converted to equivalent fuel consumption values.

(5) *Alternate phase-in standards.* Manufacturers have the option to comply with EPA emissions standards for compression-ignition engine families using an alternative phase-in schedule that correlates with EPA's OBD standards. If a manufacturer chooses to

use the alternative phase-in schedule for meeting EPA standards and optionally chooses to comply early with the NHTSA fuel consumption program, it must use the same phase-in schedule beginning in model year 2013 for fuel consumption standards and must remain in the program for each model year thereafter until model year 2020. The fuel consumption standard for each model year of the alternative phase-in schedule is provided in Table 15 of this section. Note that engine families certified to these standards are not eligible for early credits under § 535.7.

TABLE 14—PHASE 1 ALTERNATIVE PHASE-IN CI ENGINE FUEL CONSUMPTION STANDARDS
[Gallons per 100 hp-hr]

Tractors	LHD engines	MHD engines	HHD engines
Model Years 2013 to 2015	NA	5.0295	4.7642
Model Years 2016 to 2020 †	NA	4.7839	4.5187
Vocational	LHD engines	MHD engines	HHD engines
Model Years 2013 to 2015	6.0707	6.0707	5.6680
Model Years 2016 to 2020 †	5.6582	5.6582	5.4519

† **Note:** These alternate standards for 2016 and later are the same as the otherwise applicable standards for 2017 through 2020.

(6) *Alternative fuel conversions.* Engines that have been converted to operate on alternative fuels may demonstrate compliance with the standards of this part or other alternative compliance approaches allowed by EPA in 40 CFR 85.525.

(7) *Optional certification under this section.* Manufacturers certifying spark-ignition engines to the compression-ignition standards for EPA must treat those engines as compression-ignition engines for all the provisions of this part.

(8) *Advanced, innovative and off-cycle technologies.* For engines subject to Phase 1 standards, manufacturers must create separate engine families for engines that contain advanced or innovative technologies and group those engines together in an engine family if they use the same advanced or innovative technologies. Manufacturers may generate separate credit allowances for advanced and innovative technologies as specified in § 535.7(f)(1) and (2). For engines subject to Phase 2 standards, manufacturers may generate separate credits allowance for off-cycle technologies in accordance with § 535.7(f)(2). Credit incentives for advanced technology engines do not apply during the Phase 2 period.

(9) *Useful life.* The exhaust emission standards of this section apply for the full useful life, expressed in service miles, operating hours, or calendar years, whichever comes first. The following useful life values apply for the standards of this section:

(i) 120,000 miles or 11 years, whichever comes first, for CI and SI LHD engines certified to Phase 1 standards.

(ii) 150,000 miles or 15 years, whichever comes first, for CI and SI LHD and spark-ignition engines certified to Phase 2 standards.

(iii) 185,000 miles or 10 years, whichever comes first, for CI MHD engines certified to Phase 1 and for Phase 2.

(iv) 435,000 miles or 10 years, whichever comes first, for CI HHD

engines certified to Phase 1 and for Phase 2.

(v) For Phase 1 credits that manufacturers calculate based on a useful life of 110,000 miles, multiply any banked credits that it carries forward for use into the Phase 2 program by 1.36. For Phase 1 credit deficits that manufacturers generate based on a useful life of 110,000 miles multiply the credit deficit by 1.36, if offsetting the shortfall with Phase 2 credits.

(10) *Loose engines.* This paragraph (10) describes alternate emission and fuel consumption standards for loose engines certified under. The standards of this paragraph (d) and 1036.108 do not apply for loose engines certified under paragraph (a) of this section and 40 CFR 86.1819–14(k)(8). The standards in 40 CFR 1036.150(j) apply for the emissions and equivalent fuel consumption measured with the engine installed in a complete vehicle consistent with the provisions of 40 CFR 86.1819–14(k)(8)(vi).

(11) *Alternate transition option for Phase 2 engine standards.* (i) Manufacturers may optionally elect to comply with the model year 2021 primary (Phase 2) vocational vehicle and tractor engine standards in paragraph (d)(3) of this section beginning in model year 2020 (e.g. comply with the more stringent standards one year early). The model year 2021 standard would apply to these manufacturers for model years 2020 through 2023. Manufacturers that voluntarily certify their engines to model year 2021 standards early would then be eligible for less stringent engine tractor standards in model years 2024 through 2026, as follows:

(A) 5.2849 gallons per 100 hp-hr for MHD vocational vehicle engines.

(B) 4.5874 gallons per 100 hp-hr for MHD tractor engines.

(C) 4.9705 gallons per 100 hp-hr for HHD vocational vehicle engines.

(D) 4.3418 gallons per 100 hp-hr for HHD tractor engines.

(ii) The primary standard in paragraph (d)(3) applies for all manufacturers in model year 2027 and later years.

(iii) Manufacturers may apply these provisions separately for medium heavy-duty engines and heavy heavy-duty engines. This election applies to all engines in each segment. For example, if a manufacturer elects this alternate option for its medium heavy-duty engines, all of the manufacturer's medium heavy-duty vocational and tractor engines must comply. Engine fuel consumption credits generated under § 535.7(d) for manufacturers complying early with the model year 2021 standards follow the temporary extended credit life allowance in § 535.7(d)(9).

(12) *Compliance with Standards.* A manufacturer complies with the standards of this part as described in § 535.10.

(e) *Heavy-duty Trailers.* Each manufacturer of heavy-duty trailers as specified in 49 CFR 523.10, except trailers constructed in accordance with 49 CFR 571.7(f), shall comply with the fuel consumption standards in paragraph (e)(1) of this section expressed in gallons per 1000 ton-miles. Each vehicle must be manufactured to comply for its full useful life. There are no Phase 1 standards for trailers. Different levels of stringency apply for box vans depending on features that may affect aerodynamic performance. Standards apply to the trailer vehicle families within each of the trailer regulatory subcategories in accordance with § 535.4 and 40 CFR 1037.230 and based upon the applicable modeling and testing specified in § 535.6.

(1) *Fuel consumption standards for Box-Vans.* Box van trailer families manufactured in model year 2021 and later must comply with the fuel consumption standards of this section. For model years 2018 through 2020, box van trailer manufacturers have the option to voluntarily comply with the fuel consumption standards of this section. Different levels of stringency

apply for box vans depending on features that may affect aerodynamic performance. A manufacturer may optionally meet less stringent standards for different trailer types, which are characterized as follows:

(i) For trailers 35 feet or longer, a manufacturer may designate as “non-aero box vans” those box vans that have a rear lift gate or rear hinged ramp, and at least one of the following side features: Side lift gate, side-mounted pull-out platform, steps for side-door access, a drop-deck design, or belly

boxes that occupy at least half the length of both sides of the trailer between the centerline of the landing gear and the leading edge of the front wheels. For trailers less than 35 feet long, manufacturers may designate as “non-aero box vans” any refrigerated box vans with at least one of the side features identified for longer trailers.

(ii) A manufacturer may designate as “partial-aero box vans” those box vans that have at least one of the side features identified in paragraph (a)(1)(i) of this section. Long box vans may also qualify

as partial-aero box vans if they have a rear lift gate or rear hinged ramp. Note that this paragraph (e)(1)(ii) does not apply for box vans designated as “non-aero box vans” under paragraph (e)(1)(i) of this section.

(iii) “Full-aero box vans” are box vans that are not designated as non-aero box vans or partial-aero box vans under this paragraph (e)(1).

(iv) Fuel consumption standards apply for full-aero box vans as specified in the following table:

TABLE 15—PHASE 2 FULL AERO BOX VAN FUEL CONSUMPTION STANDARDS

[Gallons per 1,000 ton-miles]

Model years	Dry van		Refrigerated van	
	Long	Short	Long	Short
Voluntary Standards				
2018 to 2020	7.98625	12.31827	8.15324	12.68173
Mandatory Standards				
2021 to 2023	7.75049	12.15128	7.91749	12.52456
2024 to 2026	7.58350	11.87623	7.75049	12.24951
2027 and later	7.43615	11.72888	7.60314	12.10216

(v) Fuel consumption standards apply for partial-aero box vans as specified in the following table:

TABLE 16—PHASE 2 FUEL CONSUMPTION STANDARDS FOR PARTIAL-AERO BOX VANS

[Gallons per 1,000 ton-mile]

Model year	Dry van		Refrigerated van	
	Short	Long	Short	Long
2018–2020	12.31827	7.98625	12.68173	8.15324
2021 and later	12.15128	7.91749	12.52456	8.08448

(2) *Fuel consumption standards for Non-aero Box Vans and Non-box Trailers.* (i) Non-aero box van and non-box trailer families manufactured in model year 2021 and later must comply with the fuel consumption standards of this section. For model years 2018 through 2020, trailer manufacturers have the option to voluntarily comply with the fuel consumption standards of this section.

(ii) Non-aero box vans and non-box vans must meet the following standards:

(A) Trailers must use automatic tire inflation systems or tire pressure monitoring systems with wheels on all axles. Tire pressure monitoring systems must use low pressure warning and malfunction telltales in clear view of the driver as specified in S4.3 and S4.4 of 49 CFR 571.138.

(B) Non-box trailers must use tires with a TRRL at or below 5.1 kg/tonne. Through model year 2020, non-box trailers may instead use tires with a TRRL at or below 6.0 kg/tonne.

(C) Non-aero box vans must use tires with a TRRL at or below 4.7 kg/tonne. Through model year 2020, non-aero box vans may instead use tires with a TRRL at or below 5.1 kg/tonne.

(3) *Subfamily standards.* Starting in model year 2027, manufacturers may generate or use fuel consumption credits for averaging to demonstrate compliance with the standards specified in paragraph (e)(1)(iii) of this section as described in § 535.7(e). This requires that manufacturers specify a Family Emission Limit (FEL) for fuel consumption for each vehicle subfamily. The FEL may not be less than the result of the emission and fuel

consumption calculation in 40 CFR 1037.515. The FEL may not be greater than the appropriate standard for model year 2021 trailers. These FELs serve as the fuel consumption standards for the specific vehicle subfamily instead of the standards specified in paragraph (e)(1) of this section. Manufacturers may not use averaging for non-box trailers, partial-aero box vans, or non-aero box vans that meet standards under paragraph (e)(1)(i) or (e)(1)(ii) of this section, and manufacturers may not use fuel consumption credits for banking or trading for any trailers.

(4) *Useful life.* The fuel consumption standards of this section apply for a useful life equal to 10 years.

(5) *Transitional allowances for trailers.* Through model year 2026, trailer manufacturers may calculate a number of trailers that are exempt from

the standards and certification requirements of this part. Calculate the number of exempt box vans in a given model year by multiplying the manufacturer's total U.S.-directed production volume of certified box vans by 0.20 and rounding to the nearest whole number; however, in no case may the number of exempted box vans be greater than 350 units in any given model year. Repeat this calculation to determine the number of non-box trailers, up to 250 annual units, that are exempt from standards and certification requirements. Perform the calculation based on the manufacturer's projected production volumes in the first year that standards apply; in later years, use actual production volumes from the preceding model year. Manufacturers include these calculated values of the production volumes of exempt trailers in their annual production report under § 535.8 and 40 CFR 1037.250.

(6) *Roll-up doors for non-aero box vans.* Through model year 2023, box vans may qualify for non-aero or partial-aero standards under this paragraph (e) by treating roll-up rear doors as being equivalent to rear lift gates.

(7) *Expanded families.* A manufacturer may include refrigerated box vans in a vehicle family with dry box vans by treating them all as dry box vans for demonstrating compliance with fuel consumption standards. A manufacturer may include certain other types of trailers in a vehicle family with a different type of trailer, such that the combined set of trailers are all subject to the more stringent standards, as follows:

(i) Standards for long trailers are more stringent than standards for short trailers.

(ii) Standards for long dry box vans are more stringent than standards for short refrigerated box vans.

(iii) Standards for non-aero box vans are more stringent than standards for non-box trailers.

(8) *Compliance with standards.* A manufacturer complies with the standards of this part as described in § 535.10.

§ 535.6 Measurement and calculation procedures.

This part describes the measurement and calculation procedures manufacturers use to determine annual fuel consumption performance results. Manufacturers use the fuel consumption results determined in this part for calculating credit balances specified in

§ 535.7 and then determine whether they comply with standards as specified in § 535.10. Manufacturers must use EPA emissions test results for deriving NHTSA's fuel consumption performance rates. Consequently, manufacturers conducting testing for certification or annual demonstration testing and providing CO₂ emissions data to EPA must also provide equivalent fuel consumption results to NHTSA for all values. NHTSA and EPA reserve the right to verify separately or in coordination the results of any testing and measurement established by manufacturers in complying with the provisions of this program and as specified in 40 CFR 1037.301 and § 535.9. Any carry over data from the Phase 1 program may be carried into the Phase 2 only with approval from EPA and by using good engineering judgment considering differences in testing protocols between test procedures.

(a) *Heavy-duty pickup trucks and vans.* This section describes the method for determining the fuel consumption performance rates for test groups and for fleets of complete heavy-duty pickup trucks and vans each model year. The NHTSA heavy-duty pickup truck and van fuel consumption performance rates correspond to the same requirements for EPA as specified in 40 CFR 86.1819–14.

(1) For the Phase 1 program, if the manufacturer's fleet includes conventional vehicles (gasoline, diesel and alternative fueled vehicles) and advanced technology vehicles (hybrids with powertrain designs that include energy storage systems, vehicles with waste heat recovery, electric vehicles and fuel cell vehicles), it may divide its fleet into two separate fleets each with its own separate fleet average fuel consumption performance rate. For Phase 2, manufacturers may calculate their fleet average fuel consumption rates for a conventional fleet and separate advanced technology vehicle fleets. Advanced technology vehicle fleets should be separated into plug-in hybrid electric vehicles, electric vehicles and fuel cell vehicles.

(2) Vehicles in each fleet should be selected and divided into test groups or subconfigurations according to EPA in 40 CFR 86.1819–14(d).

(3) Use the EPA CO₂ emissions test results for each test group, in grams per mile, for the selected vehicles.

(i) Use CO₂ emissions test results for vehicles fueled by conventional and alternative fuels, including dedicated and dual-fueled (multi-fuel and flexible-

fuel) vehicles using each fuel type as specified in 40 CFR 86.1819–14(d)(10).

(ii) Use CO₂ emissions test results for dual-fueled vehicles using a weighted average of the manufacturer's emission results as specified in 40 CFR 600.510–12(k) for light-duty trucks.

(iii) All electric vehicles are deemed to have zero emissions of CO₂, CH₄, and N₂O. No emission testing is required for such electric vehicles. Assign the fuel consumption test group result to a value of zero gallons per 100 miles in paragraph (a)(4) of this section.

(iv) Use CO₂ emissions test results for cab-complete and incomplete vehicles based upon the applicable complete sister vehicles as determined in 40 CFR 1819–14(j)(2).

(v) Use CO₂ emissions test results for loose engines using applicable complete vehicles as determined in 40 CFR 86.1819–14(k)(8).

(vi) Manufacturers can choose to analytically derive CO₂ emission rates (ADCs) for test groups or subconfigurations. Use ADCs for test groups or subconfigurations in accordance with 40 CFR 86.1819–14 (d) and (g).

(4) Calculate equivalent fuel consumption results for all test groups, in gallons per 100 miles, from CO₂ emissions test group results, in grams per miles, and round to the nearest 0.001 gallon per 100 miles.

(i) Calculate the equivalent fuel consumption test group results as follows for compression-ignition vehicles and alternative fuel compression-ignition vehicles. CO₂ emissions test group result (grams per mile)/10,180 grams per gallon of diesel fuel) × (10²) = Fuel consumption test group result (gallons per 100 mile).

(ii) Calculate the equivalent fuel consumption test group results as follows for spark-ignition vehicles and alternative fuel spark-ignition vehicles. CO₂ emissions test group result (grams per mile)/8,877 grams per gallon of gasoline fuel) × (10²) = Fuel consumption test group result (gallons per 100 mile).

(5) Calculate the fleet average fuel consumption result, in gallons per 100 miles, from the equivalent fuel consumption test group results and round the fuel consumption result to the nearest 0.001 gallon per 100 miles. Calculate the fleet average fuel consumption result using the following equation.

$$\text{Fleet Average Fuel Consumption} = \frac{\sum [\text{Fuel Consumption Test Group Result}_i \times \text{Volume}_i]}{\sum [\text{Volume}_i]}$$

Where:

Fuel Consumption Test Group Result_i = fuel consumption performance for each test group as defined in 49 CFR 523.4.

Volume_i = production volume of each test group.

(6) Compare the fleet average fuel consumption standard to the fleet average fuel consumption performance. The fleet average fuel consumption performance must be less than or equal to the fleet fuel consumption standard to comply with standards in § 535.5(a).

(b) *Heavy-duty vocational vehicles and tractors.* This section describes the method for determining the fuel consumption performance rates for vehicle families of heavy-duty vocational vehicles and tractors. The NHTSA heavy-duty vocational vehicle and tractor fuel consumption performance rates correspond to the same requirements for EPA as specified in 40 CFR 1037, subpart F.

(1) Select vehicles and vehicle family configurations to test as specified in 40 CFR 1037.230 for vehicles that make up each of the manufacturer's regulatory subcategories of vocational vehicles and tractors. For the Phase 2 program, select powertrain, axle and transmission families in accordance with 40 CFR 1037.231 and 1037.232.

(2) Follow the EPA testing requirements in 40 CFR 1037.230 and 1037.501 to derive inputs for the Greenhouse gas Emissions Model (GEM).

(3) Enter inputs into GEM, in accordance with 40 CFR 1037.520, to derive the emissions and fuel consumption performance results for all vehicles (conventional, alternative fueled and advanced technology vehicles).

(4) For Phase 1 and 2, all of the following GEM inputs apply for vocational vehicles and other tractor regulatory subcategories, as follows:

(i) Model year and regulatory subcategory (see § 535.3 and 40 CFR 1037.230).

(ii) Coefficient of aerodynamic drag or drag area, as described in 40 CFR 1037.520(b) (tractors only for Phase 1).

(iii) Steer and drive tire rolling resistance, as described in 40 CFR 1037.520(c).

(iv) Vehicle speed limit, as described in 40 CFR 1037.520(d) (tractors only).

(v) Vehicle weight reduction, as described in 40 CFR 1037.520(e) (tractors only for Phase 1).

(vi) Automatic engine shutdown systems, as described in 40 CFR 1037.660 (only for Phase 1 Class 8 sleeper cabs). For Phase 1, enter a GEM input value of 5.0 g/ton-mile, or an adjusted value as specified in 40 CFR 1037.660.

(5) For Phase 2 vehicles, the GEM inputs described in paragraphs (b)(4)(i) through (v) of this section continue to apply. Note that the provisions related to vehicle speed limiters and automatic engine shutdown systems are available for vocational vehicles in Phase 2. The additional GEM inputs that apply for vocational vehicles and other tractor regulatory subcategories for demonstrating compliance with Phase 2 standards are as follows:

(i) *Engine characteristics.* Enter information from the engine manufacturer to describe the installed engine and its operating parameters as described in 40 CFR 1036.510 and 1037.520(f).

(ii) *Vehicle information.* Enter information in accordance with 40 CFR 1037.520(g) for the vehicle and its operating parameters including:

(A) Transmission make, model and type;

(B) Drive axle configuration;

(C) Drive axle ratio, k_{a1} ;

(D) GEM inputs associated with powertrain testing include powertrain family, transmission calibration identifier, test data from 40 CFR 1037.550, and the powertrain test configuration (dynamometer connected to transmission output or wheel hub).

(iii) *Idle-reduction technologies.* Identify whether the manufacturer's vehicle has qualifying idle-reduction technologies, subject to the qualifying criteria in 40 and 1037.660 and enter values for stop start and neutral idle technologies as specified in 40 CFR 1037.520(h).

(iv) *Axle and transmission efficiency.* Manufacturers may use axle efficiency maps as described in 40 CFR 1037.560 and transmission efficiency maps as described in 40 CFR 1037.565 to replace the default values in GEM.

(v) *Additional reduction technologies.* Enter input values in GEM as follows to characterize the percentage CO₂ emission reduction corresponding to certain technologies and vehicle configurations, or enter 0 as specified in 40 CFR 1037.520(j):

(A) Intelligent controls

(B) Accessory load

(C) Tire-pressure systems

(D) Extended-idle reduction

(E) Additional GEM inputs may apply as follows:

(1) Enter 1.7 and 0.9, respectively, for school buses and coach buses that have at least seven available forward gears.

(2) If the agencies approve an off-cycle technology under § 535.7(f) and 40 CFR 1037.610 in the form of an improvement factor, enter the improvement factor expressed as a percentage reduction in CO₂ emissions. (Note: In the case of approved off-cycle technologies whose benefit is quantified as a g/ton-mile credit, apply the credit to the GEM result, not as a GEM input value.)

(vi) *Vehicles with hybrid power take-off (PTO).* For vocational vehicles, determine the delta PTO emission result of the manufacturer's engine and hybrid power take-off system as described in 40 CFR 1037.540.

(vii) *Aerodynamic improvements for vocational vehicles.* For vocational vehicles certified using the Regional duty cycle, enter $\Delta C_d A$ values to account for using rear fairings and a reduced minimum frontal area as specified in 40 CFR 1037.520(m) and 1037.527.

(viii) *Alternate fuels.* For fuels other than those identified in GEM, perform the simulation by identifying the vehicle as being diesel-fueled if the engine is subject to the compression-ignition standard, or as being gasoline-fueled if the engine is subject to the spark-ignition standards. Correct the engine or powertrain fuel map for mass-specific net energy content as described in 40 CFR 1036.535(b).

(ix) *Custom chassis vehicles.* A simplified version of GEM applies for custom chassis vehicle subject § 535.5(b)(6) in accordance with 40 CFR 1037.520(a)(2)(ii).

(6) In unusual circumstances, manufacturers may ask EPA to use weighted average results of multiple GEM runs to represent special technologies for which no single GEM run can accurately reflect.

(7) From the GEM results, select the CO₂ family emissions level (FEL) and equivalent fuel consumption values for vocational vehicle and tractor families in each regulatory subcategory for each model year. Equivalent fuel consumption FELs are derived in GEM and expressed to the nearest 0.0001 gallons per 1000 ton-mile. For families containing multiple subfamilies, identify the FELs for each subfamily.

(c) [Reserved]

(d) *Heavy-duty engines*. This section describes the method for determining equivalent fuel consumption family certification level (FCL) values for engine families of heavy-duty truck tractors and vocational vehicles. The NHTSA heavy-duty engine fuel consumption FCLs are determined from the EPA FCLs tested in accordance with 40 CFR 1036, subpart F. Each engine family must use the same primary intended service class as designated for EPA in accordance with 40 CFR 1036.140.

(1) Manufacturers must select emission-data engines representing the tested configuration of each engine family specified in 40 CFR part 86 and 40 CFR 1036.235 for engines in heavy-duty truck tractors and vocational vehicles that make up each of the manufacture's regulatory subcategories.

(2) Standards in § 535.5(d) apply to the CO₂ emissions rates for each emissions-data engine in an engine family subject to the procedures and equipment specified in 40 CFR part 1036, subpart F. Determine equivalent fuel consumption rates using CO₂ emissions rates in grams per hp-hr measured to at least one more decimal place than that of the applicable EPA standard in 40 CFR 1036.108.

(i) Use the CO₂ emissions test results for engines running on each fuel type for conventional, dedicated, multi-fueled (dual-fuel, and flexible-fuel) engines as specified in 40 CFR part 1036, subpart F.

(ii) Use the CO₂ emissions result for multi-fueled engines using the same weighted fuel mixture emission results as specified in 40 CFR 1036.235 and 40 CFR part 1036, subpart F.

(iii) Use the CO₂ emissions test results for hybrid engines as described in 40 CFR 1036.525.

(iv) All electric vehicles are deemed to have zero emissions of CO₂ and zero fuel consumption. No emission or fuel consumption testing is required for such electric vehicles.

(3) Use the CO₂ emissions test results for tractor engine families in accordance with 40 CFR 1036.501 and for vocational vehicle engine families in accordance with 40 CFR part 86, subpart N, for each heavy-duty engine regulatory subcategory for each model year.

(i) If a manufacturer certifies an engine family for use both as a vocational engine and as a tractor engine, the manufacturer must split the family into two separate subfamilies in accordance with 40 CFR 1036.230. The manufacturer may assign the numbers and configurations of engines within the

respective subfamilies at any time prior to the submission of the end-of-year report required by 40 CFR 1036.730 and § 535.8. The manufacturer must track into which type of vehicle each engine is installed, although EPA may allow the manufacturer to use statistical methods to determine this for a fraction of its engines.

(ii) The following engines are excluded from the engine families used to determine fuel consumption FCL values and the benefit for these engines is determined as an advanced technology credit under the ABT provisions provided in § 535.7(e); these provisions apply only for the Phase 1 program:

(A) Engines certified as hybrid engines or power packs.

(B) Engines certified as hybrid engines designed with PTO capability and that are sold with the engine coupled to a transmission.

(C) Engines with Rankine cycle waste heat recovery.

(4) Manufacturers generating CO₂ emissions rates to demonstrate compliance to EPA vehicle standards for model years 2021 and later, using engine fuel maps determined in accordance with 40 CFR 1036.535 and 1036.540 or engine powertrain results in accordance with 40 CFR 1036.630 and 40 CFR 1037.550 for each engine configuration, must use the same compliance pathway and model years for certifying under the NHTSA program. Manufacturers may omit providing equivalent fuel consumption FCLs under this section if all of its engines will be installed in vehicles that are certified based on powertrain testing as described in 40 CFR 1037.550.

(5) Calculate equivalent fuel consumption values from the emissions CO₂ FCLs levels for certified engines, in gallons per 100 hp-hr and round each fuel consumption value to the nearest 0.0001 gallon per 100 hp-hr.

(i) Calculate equivalent fuel consumption FCL values for compression-ignition engines and alternative fuel compression-ignition engines. CO₂ FCL value (grams per hp-hr)/10,180 grams per gallon of diesel fuel) $\times (10^2)$ = Fuel consumption FCL value (gallons per 100 hp-hr).

(ii) Calculate equivalent fuel consumption FCL values for spark-ignition engines and alternative fuel spark-ignition engines. CO₂ FCL value (grams per hp-hr)/8,877 grams per gallon of gasoline fuel) $\times (10^2)$ = Fuel consumption FCL value (gallons per 100 hp-hr).

(iii) Manufacturers may carryover fuel consumption data from a previous model year if allowed to carry over

emissions data for EPA in accordance with 40 CFR 1036.235.

(iv) If a manufacturer uses an alternate test procedure under 40 CFR 1065.10 and subsequently the data is rejected by EPA, NHTSA will also reject the data.

(e) *Heavy-duty trailers*. This section describes the method for determining the fuel consumption performance rates for trailers. The NHTSA heavy-duty trailers fuel consumption performance rates correspond to the same requirements for EPA as specified in 40 CFR part 1037, subpart F.

(1) Select trailer family configurations that make up each of the manufacturer's regulatory subcategories of heavy-duty trailers in 40 CFR 1037.230 and § 535.4.

(2) Obtain preliminary approvals for trailer aerodynamic devices from EPA in accordance with 40 CFR 1037.150.

(3) For manufacturers voluntarily complying in model years 2018 through 2020, and for trailers complying with mandatory standards in model years 2021 and later, determine the CO₂ emissions and fuel consumption results for partial- and full-aero trailers using the equations and technologies specified in 40 CFR part 1037, subpart F. Use testing to determine input values in accordance with 40 CFR 1037.515.

(4) From the equation results, use the CO₂ family emissions level (FEL) to calculate equivalent fuel consumption FELs are expressed to the nearest 0.0001 gallons per 1000 ton-mile.

(i) For families containing multiple subfamilies, identify the FELs for each subfamily.

(ii) Calculate equivalent fuel consumption FEL values for trailer families. CO₂ FEL value (grams per 1000 ton-mile)/10,180 grams per 1000 ton-mile of diesel fuel) $\times (10^3)$ = Fuel consumption FEL value. The equivalent fuel consumption FELs are expressed to the nearest 0.0001 gallons per 1000 ton-mile.

§ 535.7 Averaging, banking, and trading (ABT) credit program.

(a) *General provisions*. After the end of each model year, manufacturers must comply with the fuel consumption standards in § 535.5 for averaging, banking and trading credits. Trailer manufacturers are excluded from this section except for those producing full-aero box trailers, which may comply with special provisions in paragraph (e) of this section. Manufacturers comply with standards if the sum of averaged, banked and traded credits generate a "zero" credit balance or a credit surplus within an averaging set of vehicles or engines. Manufacturers fail to comply with standards if the sum of the credit flexibilities generate a credit deficit (or

shortfall) in an averaging set. Credit shortfalls must be offset by banked or traded credits within three model years after the shortfall is incurred. These processes are hereafter referenced as the NHTSA ABT credit program. The following provisions apply to all fuel consumption credits.

(1) *Credits (or fuel consumption credits (FCCs))*. Credits in this part mean a calculated weighted value representing the difference between the fuel consumption performance and the standard of a vehicle or engine family or fleet within a particular averaging set. Positive credits represent cases where a vehicle or engine family or fleets perform better than the applicable standard (the fuel consumption performance is less than the standard) whereas negative credits represent underperforming cases. The value of a credit is calculated according to paragraphs (b) through (e) of this section. FCCs are only considered earned or useable for averaging, banking or trading after EPA and NHTSA have verified the information in a manufacturer's final reports required in § 535.8. Types of FCCs include the following:

(i) *Conventional credits*. Credits generated by vehicle or engine families or fleets containing conventional vehicles (*i.e.*, gasoline, diesel and alternative fueled vehicles).

(ii) *Early credits*. Credits generated by vehicle or engine families or fleets produced for model year 2013. Early credits are multiplied by an incentive factor of 1.5 times.

(iii) *Advanced technology credits*. Credits generated by vehicle or engine families or subconfigurations containing vehicles with advanced technologies (*i.e.*, hybrids with regenerative braking, vehicles equipped with Rankine-cycle engines, electric and fuel cell vehicles) and incentivized under this ABT credit program in paragraph (f)(1) of this section and by EPA under 40 CFR 86.1819–14(d)(7), 1036.615, and 1037.615.

(iv) *Innovative and off-cycle technology credits*. Credits can be generated by vehicle or engine families or subconfigurations having fuel consumption reductions resulting from technologies not reflected in the GEM simulation tool or in the FTP chassis dynamometer and that were not in common use with heavy-duty vehicles or engines before model year 2010 that are not reflected in the specified test procedure. Manufacturers should prove that these technologies were not in common use in heavy-duty vehicles or engines before model year 2010 by demonstrating factors such as the

penetration rates of the technology in the market. NHTSA will not approve any request if it determines that these technologies do not qualify. The approach for determining innovative and off-cycle technology credits under this fuel consumption program is described in paragraph (f)(2) of this section and by EPA under 40 CFR 86.1819–14(d)(13), 1036.610, and 1037.610.

(2) *Averaging*. Averaging is the summing of a manufacturer's positive and negative FCCs for engines or vehicle families or fleets within an averaging set. The principle averaging sets are defined in § 535.4.

(i) A credit surplus occurs when the net sum of the manufacturer's generated credits for engines or vehicle families or fleets within an averaging set is positive (a zero credit balance is when the sum equals zero).

(ii) A credit deficit occurs when the net sum of the manufacturer's generated credits for engines or vehicle families or fleets within an averaging set is negative.

(iii) Positive credits, other than advanced technology credits, generated and calculated within an averaging set may only be used to offset negative credits within the same averaging set.

(iv) Manufacturers may certify one or more vehicle families (or subfamilies) to an FEL above the applicable fuel consumption standard, subject to any applicable FEL caps and other provisions allowed by EPA in 40 CFR parts 1036 and 1037, if the manufacturer shows in its application for certification to EPA that its projected balance of all FCC transactions in that model year is greater than or equal to zero or that a negative balance is allowed by EPA under 40 CFR 1036.745 and 1037.745.

(v) If a manufacturer certifies a vehicle family to an FEL that exceeds the otherwise applicable standard, it must obtain enough FCC to offset the vehicle family's deficit by the due date of its final report required in § 535.8. The emission credits used to address the deficit may come from other vehicle families that generate FCCs in the same model year (or from the next three subsequent model years), from banked FCCs from previous model years, or from FCCs generated in the same or previous model years that it obtained through trading. Note that the option for using banked or traded credits does not apply for trailers.

(vi) Manufacturers may certify a vehicle or engine family using an FEL (as described in § 535.6) below the fuel consumption standard (as described in § 535.5) and choose not to generate conventional fuel consumption credits

for that family. Manufacturers do not need to calculate fuel consumption credits for those families and do not need to submit or keep the associated records described in § 535.8 for these families. Manufacturers participating in NHTSA's FCC program must provide reports as specified in § 535.8.

(3) *Banking*. Banking is the retention of surplus FCC in an averaging set by the manufacturer for use in future model years for the purpose of averaging or trading.

(i) Surplus credits may be banked by the manufacturer for use in future model years, or traded, given the restriction that the credits have an expiration date of five model years after the year in which the credits are generated. For example, banked credits earned in model year 2014 may be utilized through model year 2019. Surplus credits will become banked credits unless a manufacturer contacts NHTSA to expire its credits.

(ii) Surplus credits become earned or usable banked FCCs when the manufacturer's final report is approved by both agencies. However, the agencies may revoke these FCCs at any time if they are unable to verify them after reviewing the manufacturer's reports or auditing its records.

(iii) Banked FCC retain the designation from the averaging set and model year in which they were generated.

(iv) Banked credits retain the designation of the averaging set in which they were generated.

(v) Trailer manufacturers generating credits in paragraph (e) of this section may not bank credits except to resolve credit deficits in the same model year or from up to three prior model years.

(4) *Trading*. Trading is a transaction that transfers banked FCCs between manufacturers or other entities in the same averaging set. A manufacturer may use traded FCCs for averaging, banking, or further trading transactions.

(i) Manufacturers may only trade banked credits to other manufacturers to use for compliance with fuel consumption standards. Traded FCCs, other than advanced technology credits, may be used only within the averaging set in which they were generated. Manufacturers may only trade credits to other entities for the purpose of expiring credits.

(ii) Advanced technology credits can be traded across different averaging sets.

(iii) The agencies may revoke traded FCCs at any time if they are unable to verify them after reviewing the manufacturer's reports or auditing its records.

(iv) If a negative FCC balance results from a transaction, both the buyer and seller are liable, except in cases the agencies deem to involve fraud. See § 535.9 for cases involving fraud. EPA also may void the certificates of all vehicle families participating in a trade that results in a manufacturer having a negative balance of emission credits. See 40 CFR 1037.745.

(v) Trailer manufacturers generating credits in paragraph (e) of this section starting in model year 2027 may not bank or trade credits. These manufacturers may only use credits for the purpose of averaging.

(vi) Manufacturers with deficits or projecting deficits before or during a production model year may not trade credits until its available credits exceed the deficit. Manufacturers with a deficit may not trade credits if the deadline to offset that credit deficit has passed.

(5) *Credit deficit (or credit shortfall)*. A credit shortfall or deficit occurs when the sum of the manufacturer's generated credits for engines or vehicle families or fleets within an averaging set is negative. Credit shortfalls must be offset by an available credit surplus within three model years after the shortfall was incurred. If the shortfall cannot be offset, the manufacturer is liable for civil penalties as discussed in § 535.9.

(6) *FCC credit plan*. (i) Each model year manufacturers submit credit plan in their certificates of conformity as required in 40 CFR 1036.725(b)(2) and 40 CFR 1037.725(b)(2). The plan is required to contain equivalent fuel consumption information in accordance § 535.8(c). The plan must include:

(A) Detailed calculations of projected emission and fuel consumption credits (positive or negative) based on projected U.S.-directed production volumes. The agencies may require a manufacturer to include similar calculations from its other engine or vehicle families to project its net credit balances for the model year. If a manufacturer projects negative emission and/or fuel consumption credits for a family, it must state the source of positive emission and/or fuel consumption credits it expects to use to offset the negative credits demonstrating how it plans to resolve any credit deficits that might occur for a model year within a period of up to three model years after that deficit has occurred.

(B) Actual emissions and fuel consumption credit balances, credit transactions, and credit trades.

(ii) Manufacturers are required to provide updated credit plans after receiving their final verified reports from EPA and NHTSA after the end of each model year.

(iii) The agencies may determine that a manufacturer's plan is unreasonable or unrealistic based on a consideration of past and projected use of specific technologies, the historical sales mix of its vehicle models, subsequent failure to follow any submitted plans, and limited expected access to traded credits.

(iv) The agencies may also consider the plan unreasonable if the manufacturer's credit deficit increases from one model year to the next. The agencies may require that the manufacturers must send interim reports describing its progress toward resolving its credit deficit over the course of a model year.

(v) If NHTSA determines that a manufacturer's plan is unreasonable or unrealistic, the manufacturer is deemed as not comply with fuel consumption standards as specified in § 535.10(c) and the manufacturer may be liable for civil penalties.

(7) *Revoked credits*. NHTSA may revoke fuel consumption credits if unable to verify any information after auditing reports or records or conducting confirmatory testing. In the cases where EPA revokes emissions CO₂ credits, NHTSA will revoke the equivalent amount of fuel consumption credits.

(8) *Transition to Phase 2 standards*. The following provisions allow for enhanced use of fuel consumption credits from Phase 1 tractors and vocational vehicles for meeting the Phase 2 standards:

(i) Fuel consumption credits a manufacturer generates for light and medium heavy-duty vocational vehicles in model years 2018 through 2021 may be used through model year 2027, instead of being limited to a five-year credit life as specified in this part.

(ii) The manufacturer may use the off-cycle provisions of paragraph (f) of this section to apply technologies to Phase 1 vehicles as follows:

(A) A manufacturer may apply an improvement factor of 0.988 for tractors and vocational vehicles with automatic tire inflation systems on all axles.

(B) For vocational vehicles with automatic engine shutdown systems that conform with 40 CFR 1037.660, a manufacturer may apply an improvement factor of 0.95.

(C) For vocational vehicles with stop-start systems that conform with 40 CFR 1037.660, a manufacturer may apply an improvement factor of 0.92.

(D) For vocational vehicles with neutral-idle systems conforming with 40 CFR 1037.660, manufacturers may apply an improvement factor of 0.98.

Manufacturers may adjust this improvement factor if we approve a

partial reduction under 40 CFR 1037.660(a)(2); for example, if the manufacturer's design reduces fuel consumption by half as much as shifting to neutral, it may apply an improvement factor of 0.99.

(9) *Credits for small business manufacturers*. Small manufacturers may generate fuel consumption credits for natural gas-fueled vocational vehicles as follows:

(i) Small manufacturers may certify their vehicles instead of relying on the exemption of § 535.3.

(ii) Use Phase 1 GEM to determine a fuel consumption level for vehicle, then multiply this value by the engine's FCL for fuel consumption and divide by the engine's applicable fuel consumption standard.

(iii) Use the value determined in paragraph (ii) in the credit equation specified in part (c) of this section in place of the term (Std – FEL).

(iv) The following provisions apply uniquely to small businesses under the custom-chassis standards of § 535.5(b)(6):

(A) Manufacturers may use fuel consumption credits generated under paragraph (c) of this section, including banked or traded credits from any averaging set. Such credits remain subject to other limitations that apply under this part.

(B) Manufacturers may produce up to 200 drayage tractors in a given model year to the standards described in § 535.5(b)(6) for "other buses". Treat these drayage tractors as being in their own averaging set.

(10) *Certifying non-gasoline engines*. A manufacturer producing non-gasoline engines complying with model year 2021 or later medium heavy-duty spark-ignition standards may not generate fuel consumption credits. Only manufacturers producing gasoline engines certifying to spark-ignition standards can generate fuel consumption credits under paragraph (d) of this part.

(b) *ABT provisions for heavy-duty pickup trucks and vans*. (1) Calculate fuel consumption credits in a model year for one fleet of conventional heavy-duty pickup trucks and vans and if designated by the manufacturer another consisting of advance technology vehicles for the averaging set as defined in § 535.4. Calculate credits for each fleet separately using the following equation:

$$\text{Total MY Fleet FCC (gallons)} = (\text{Std} - \text{Act}) \times (\text{Volume}) \times (\text{UL}) \times (10^2)$$

Where:

Std = Fleet average fuel consumption standard (gal/100 mile).

Act = Fleet average actual fuel consumption value (gal/100 mile).
 Volume = the total U.S.-directed production of vehicles in the regulatory subcategory.
 UL = the useful life for the regulatory subcategory. The useful life value for heavy-pickup trucks and vans manufactured for model years 2013 through 2020 is equal to the 120,000 miles. The useful life for model years 2021 and later is equal to 150,000 miles.

(2) Adjust the fuel consumption performance of subconfigurations with advanced technology for determining the fleet average actual fuel consumption value as specified in paragraph (f)(1) of this section and 40 CFR 86.1819–14(d)(7). Advanced technology vehicles can be separated in a different fleet for the purpose of applying credit incentives as described in paragraph (f)(1) of this section.

(3) Adjust the fuel consumption performance for subconfigurations with innovative technology. A manufacturer is eligible to increase the fuel consumption performance of heavy-duty pickup trucks and vans in accordance with procedures established by EPA set forth in 40 CFR part 600. The eligibility of a manufacturer to increase its fuel consumption performance through use of an off-cycle technology requires an application request made to EPA and NHTSA in accordance with 40 CFR 86.1869–12 and an approval granted by the agencies. For off-cycle technologies that are covered under 40 CFR 86.1869–12, NHTSA will collaborate with EPA regarding NHTSA's evaluation of the specific off-cycle technology to ensure its impact on fuel consumption and the suitability of using the off-cycle technology to adjust fuel consumption performance. NHTSA will provide its views on the suitability of the technology for that purpose to EPA. NHTSA will apply the criteria in section (f) of this section in granting or denying off-cycle requests.

(4) Fuel consumption credits may be generated for vehicles certified in model year 2013 to the model year 2014 standards in § 535.5(a). If a manufacturer chooses to generate CO₂ emission credits under EPA's provisions in 40 CFR part 86, it may also voluntarily generate early credits under the NHTSA fuel consumption program. To do so, a manufacturer must certify its entire U.S.-directed production volume of vehicles in its fleet. The same production volume restrictions specified in 40 CFR 1037.150(a)(2) relating to when test groups are certified apply to the NHTSA early credit provisions. Credits are calculated as specified in paragraph (b)(3) of this section relative to the fleet standard that

would apply for model year 2014 using the model year 2013 production volumes. Surplus credits generated under this paragraph (b)(4) are available for banking or trading. Credit deficits for an averaging set prior to model year 2014 do not carry over to model year 2014. These credits may be used to show compliance with the standards of this part for 2014 and later model years. Once a manufacturer opts into the NHTSA program they must stay in the program for all of the optional model years and remain standardized with the same implementation approach being followed to meet the EPA CO₂ emission program.

(5) Calculate the averaging set credit value by summing together the fleet credits for conventional and advanced technology vehicles including any adjustments for innovative technologies. Manufacturers may sum conventional and innovative technology credits before adding any advanced technology credits in each averaging set.

(6) For credits that manufacturers calculate based on a useful life of 120,000 miles, multiply any banked credits carried forward for use in model year 2021 and later by 1.25. For credit deficits that a manufacturer calculates based on a useful life of 120,000 miles and that it offsets with credits originally earned in model year 2021 and later, it multiplies the credit deficit by 1.25.

(c) *ABT provisions for vocational vehicles and tractors.* (1) Calculate the fuel consumption credits in a model year for each participating family or subfamily consisting of conventional vehicles in each averaging set (as defined in § 535.4) using the equation in this section. Each designated vehicle family or subfamily has a "family emissions limit" (FEL) that is compared to the associated regulatory subcategory standard. An FEL that falls below the regulatory subcategory standard creates "positive credits," while fuel consumption level of a family group above the standard creates a "negative credits." The value of credits generated for each family or subfamily in a model year is calculated as follows and must be rounded to nearest whole number:

$$\text{Vehicle Family FCC (gallons)} = (\text{Std} - \text{FEL}) \times (\text{Payload}) \times (\text{Volume}) \times (\text{UL}) \times (10^3)$$

Where:

Std = the standard for the respective vehicle family regulatory subcategory (gal/1000 ton-mile).

FEL = family emissions limit for the vehicle family (gal/1000 ton-mile).

Payload = the prescribed payload in tons for each regulatory subcategory as shown in the following table:

Regulatory subcategory	Payload (tons)
Vocational LHD Vehicles	2.85
Vocational MHD Vehicles	5.60
Vocational HHD Vehicles	7.5
MDH Tractors	12.50
HHD Tractors, other than heavy-haul Tractors	19.00
Heavy-haul Tractors	43.00

Volume = the number of U.S.-directed production volume of vehicles in the corresponding vehicle family.

UL = the useful life for the regulatory subcategory (miles) as shown in the following table:

Regulatory subcategory	UL (miles)
LHD Vehicles	110,000 (Phase 1). 150,000 (Phase 2). 185,000.
Vocational MHD Vehicles and tractors at or below 33,000 pounds GVWR.	
Vocation HHD Vehicles and tractors at or above 33,000 pounds GVWR.	435,000.

(i) Calculate the value of credits generated in a model year for each family or subfamily consisting of vehicles with advanced technology vehicles in each averaging set using the equation above and the guidelines provided in paragraph (f)(1) of this section. Manufacturers may generate credits for advanced technology vehicles using incentives specified in paragraph (f)(1) of this section.

(ii) Calculate the value of credits generated in a model year for each family or subfamily consisting of vehicles with off-cycle technology vehicles in each averaging set using the equation above and the guidelines provided in paragraph (f)(2) of this section.

(2) Manufacturers must sum all negative and positive credits for each vehicle family within each applicable averaging set to obtain the total credit balance for the model year before rounding. The sum of fuel consumptions credits must be rounded to the nearest gallon. Calculate the total credits generated in a model year for each averaging set using the following equation:

$$\text{Total averaging set MY credits} = \Sigma$$

Vehicle family credits within each averaging set

(3) Manufacturers can sum conventional and innovative technology credits before adding any advanced technology credits in each averaging set.

(4) If a manufacturer chooses to generate CO₂ emission credits under

EPA provisions of 40 CFR 1037.150(a), it may also voluntarily generate early credits under the NHTSA fuel consumption program as follows:

(i) Fuel consumption credits may be generated for vehicles certified in model year 2013 to the model year 2014 standards in § 535.5(b) and (c). To do so, a manufacturer must certify its entire U.S.-directed production volume of vehicles. The same production volume restrictions specified in 40 CFR 1037.150(a)(1) relating to when test groups are certified apply to the NHTSA early credit provisions. Credits are calculated as specified in paragraph (c)(11) of this section relative to the standards that would apply for model year 2014. Surplus credits generated under this paragraph (c)(4) may be increased by a factor of 1.5 for determining total available credits for banking or trading. For example, if a manufacturer has 10 gallons of surplus credits for model year 2013, it may bank 15 gallons of credits. Credit deficits for an averaging set prior to model year 2014 do not carry over to model year 2014. These credits may be used to show compliance with the standards of this part for 2014 and later model years. Once a manufacturer opts into the NHTSA program they must stay in the program for all of the optional model years and remain standardized with the same implementation approach being followed to meet the EPA CO₂ emission program.

(ii) A tractor manufacturer may generate fuel consumption credits for the number of additional SmartWay designated tractors (relative to its MY 2012 production), provided that credits are not generated for those vehicles under paragraph (c)(4)(i) of this section. Calculate credits for each regulatory sub-category relative to the standard that would apply in model year 2014 using the equations in paragraph (c)(2) of this section. Use a production volume equal to the number of verified model year 2013 SmartWay tractors minus the number of verified model year 2012 SmartWay tractors. A manufacturer may bank credits equal to the surplus credits generated under this paragraph multiplied by 1.50. A manufacturer's 2012 and 2013 model years must be equivalent in length. Once a manufacturer opts into the NHTSA program they must stay in the program for all of the optional model years and remain standardized with the same implementation approach being followed to meet the EPA CO₂ emission program.

(5) If a manufacturer generates credits from vehicles certified for advanced technology in accordance with

paragraph (e)(1) of this section, a multiplier of 1.5 can be used, but this multiplier cannot be used on the same credits for which the early credit multiplier is used.

(6) For model years 2012 and later, manufacturers may generate or use fuel consumption credits for averaging to demonstrate compliance with the alternative standards as described in § 535.5(b)(6) of this part. Manufacturers can specify a Family Emission Limit (FEL) for fuel consumption for each vehicle subfamily. The FEL may not be less than the result of emissions and fuel consumption modeling as described in 40 CFR 1037.520 and § 535.6. These FELs serve as the fuel consumption standards for the vehicle subfamily instead of the standards specified in this § 535.5(b)(6). Manufacturers may not use averaging for motor homes, coach buses, emergency vehicles or concrete mixers meeting standards under § 535.5(b)(5).

(7) Manufacturers may not use averaging for vehicles meeting standards § 535.5(b)(6)(iv) through (vi), and manufacturers may not use fuel consumption credits for banking or trading for any vehicles certified under § 535.5(b)(6).

(8) Manufacturers certifying any vehicles under § 535.5(b)(6) must consider each separate vehicle type (or group of vehicle types) as a separate averaging set.

(d) *ABT provisions for heavy-duty engines.* (1) Calculate the fuel consumption credits in a model year for each participating family or subfamily consisting of engines in each averaging set (as defined in § 535.4) using the equation in this section. Each designated engine family has a "family certification level" (FCL) which is compared to the associated regulatory subcategory standard. A FCL that falls below the regulatory subcategory standard creates "positive credits," while fuel consumption level of a family group above the standard creates a "credit shortfall." The value of credits generated in a model year for each engine family or subfamily is calculated as follows and must be rounded to nearest whole number:

$$\text{Engine Family FCC (gallons)} = (\text{Std} - \text{FCL}) \times (\text{CF}) \times (\text{Volume}) \times (\text{UL}) \times (10^2)$$

Where:

Std = the standard for the respective engine regulatory subcategory (gal/100 hp-hr).
FCL = family certification level for the engine family (gal/100 hp-hr).

CF = a transient cycle conversion factor in hp-hr/mile which is the integrated total cycle horsepower-hour divided by the equivalent mileage of the applicable test

cycle. For engines subject to spark-ignition heavy-duty standards, the equivalent mileage is 6.3 miles. For engines subject to compression-ignition heavy-duty standards, the equivalent mileage is 6.5 miles.

Volume = the number of engines in the corresponding engine family.

UL = the useful life of the given engine family (miles) as shown in the following table:

Regulatory subcategory	UL (miles)
SI and CI LHD Engines	120,000 (Phase 1). 150,000 (Phase 2).
CI MHD Engines	185,000.
CI HHD Engines	435,000.

(i) Calculate the value of credits generated in a model year for each family or subfamily consisting of engines with advanced technology vehicles in each averaging set using the equation above and the guidelines provided in paragraph (f)(1) of this section. Manufacturers may generate credits for advanced technology vehicles using incentives specified in paragraph (f)(1) of this section.

(ii) Calculate the value of credits generated in a model year for each family or subfamily consisting of engines with off-cycle technology vehicles in each averaging set using the equation above and the guidelines provided in paragraph (f)(2) of this section.

(2) Manufacturers shall sum all negative and positive credits for each engine family within the applicable averaging set to obtain the total credit balance for the model year before rounding. The sum of fuel consumptions credits should be rounded to the nearest gallon.

Calculate the total credits generated in a model year for each averaging set using the following equation:

$$\text{Total averaging set MY credits} = \Sigma \text{Engine family credits within each averaging set}$$

(3) The provisions of this section apply to manufacturers utilizing the compression-ignition engine voluntary alternate standard provisions specified in § 535.5(d)(4) as follows:

(i) Manufacturers may not certify engines to the alternate standards if they are part of an averaging set in which they carry a balance of banked credits. For purposes of this section, manufacturers are deemed to carry credits in an averaging set if they carry credits from advance technology that are allowed to be used in that averaging set.

(ii) Manufacturers may not bank fuel consumption credits for any engine

family in the same averaging set and model year in which it certifies engines to the alternate standards. This means a manufacturer may not bank advanced technology credits in a model year it certifies any engines to the alternate standards.

(iii) Note that the provisions of paragraph (d)(10) of this section apply with respect to credit deficits generated while utilizing alternate standards.

(4) Where a manufacturer has chosen to comply with the EPA alternative compression-ignition engine phase-in standard provisions in 40 CFR 1036.150(e), and has optionally decided to follow the same path under the NHTSA fuel consumption program, it must certify all of its model year 2013 compression-ignition engines within a given averaging set to the applicable alternative standards in § 535.5(d)(5). Engines certified to these standards are not eligible for early credits under paragraph (d)(14) of this section. Credits are calculated using the same equation provided in paragraph (d)(11) of this section.

(5) If a manufacturer chooses to generate early CO₂ emission credits under EPA provisions of 40 CFR 1036.150, it may also voluntarily generate early credits under the NHTSA fuel consumption program. Fuel consumption credits may be generated for engines certified in model year 2013 (2015 for spark-ignition engines) to the standards in § 535.5(d). To do so, a manufacturer must certify its entire U.S.-directed production volume of engines except as specified in 40 CFR 1036.150(a)(2). Credits are calculated as specified in paragraph (d)(11) of this section relative to the standards that would apply for model year 2014 (2016 for spark-ignition engines). Surplus credits generated under this paragraph (d)(3) may be increased by a factor of 1.5 for determining total available credits for banking or trading. For example, if a manufacturer has 10 gallons of surplus credits for model year 2013, it may bank 15 gallons of credits. Credit deficits for an averaging set prior to model year 2014 (2016 for spark-ignition engines) do not carry over to model year 2014 (2016 for spark-ignition engines). These credits may be used to show compliance with the standards of this part for 2014 and later model years. Once a manufacturer opts into the NHTSA program they must stay in the program for all of the optional model years and remain standardized with the same implementation approach being followed to meet the EPA CO₂ emission program.

(6) Manufacturers may generate fuel consumption credits from an engine

family subject to spark-ignition standards for exchanging with other engine families only if the engines in the family are gasoline-fueled.

(7) Engine credits generated for compression-ignition engines in the 2020 and earlier model years may be used in model year 2021 and later only if the credit-generating engines were certified to the tractor standards in § 535.5(d) and 40 CFR 1036.108. Manufacturers may otherwise use fuel consumption credits generated in one model year without adjustment for certifying vehicles in a later model year, even if fuel consumption standards are different.

(8) Engine families manufacturers certify with a nonconformance penalty under 40 CFR part 86, subpart L, and may not generate fuel consumption credits.

(9) *Alternate transition option for Phase 2 engine standards.* The following provisions allow for enhanced generation and use of fuel consumption credits for manufacturers complying with engines standards in accordance with § 535.7(d)(11):

(i) If a manufacturer is eligible to certify all of its model year 2020 engines within the averaging set to the tractor and vocational vehicle engine standards in § 535.5(d)(11) and the requirements applicable to model year 2021 engines, the banked and traded fuel consumption credits generated for model year 2018 through 2024 engines may be used through model year 2030 as specified in paragraph (d)(9)(ii) of this section or through a five-year credit life, whichever is later.

(ii) Banked and traded fuel consumption credits generated under this paragraph (d)(9) for model year 2018 through 2024 engines may be used through model year 2030 with the extended credit life values shown in the table:

Model year	Credit life for transition option for phase 2 engine standards (years)
2018	12
2019	11
2020	10
2021	9
2022	8
2023	7
2024	6
2025 and later	5

(e) *ABT provisions for trailers.* (1) Manufacturers cannot use averaging for non-box trailers, partial-aero trailers, or non-aero trailers or cannot use fuel consumption credits for banking or

trading. Starting in model year 2027, full aero box van manufactures may average, credits.

(2) Calculate the fuel consumption credits in a model year for each participating family or subfamily consisting of full aero box trailers (vehicles) in each averaging set (as defined in § 535.4) using the equation in this section. Each designated vehicle family or subfamily has a “family emissions limit” (FEL) which is compared to the associated regulatory subcategory standard. An FEL that falls below the regulatory subcategory standard creates “positive credits,” while fuel consumption level of a family group above the standard creates a “negative credits.” The value of credits generated for each family or subfamily in a model year is calculated as follows and must be rounded to nearest whole number:

$$\text{Vehicle Family FCC (gallons)} = (\text{Std} - \text{FEL}) \times (\text{Payload}) \times (\text{Volume}) \times (\text{UL}) \times (10^3)$$

Where:

Std = the standard for the respective vehicle family regulatory subcategory (gal/1000 ton-mile).

FEL = family emissions limit for the vehicle family (gal/1000 ton-mile).

Payload = 10 tons for short box vans and 19 tons for other trailers.

Volume = the number of U.S.-directed production volume of vehicles in the corresponding vehicle family.

UL = the useful life for the regulatory subcategory. The useful life value for heavy-duty trailers is equal to the 250,000 miles.

(3) Trailer manufacturers may not generate advanced technology credits.

(4) Manufacturers shall sum all negative and positive credits for each vehicle family within the applicable averaging set to obtain the total credit balance for the model year before rounding. Calculate the total credits generated in a model year for each averaging set using the following equation:

$$\text{Total averaging set MY credits} = \Sigma \text{Vehicle family credits within each averaging set}$$

(5) Trailer manufacturers may not bank credits within an averaging set but surplus fuel consumption credits from a given model year may be used to offset deficits from earlier model years.

(f) *Additional credit provisions—(1) Advanced technology credits.* (i) For the Phase 1 program, manufacturers of heavy-duty pickup trucks and vans, vocational vehicles, tractors and the associated engines showing improvements in CO₂ emissions and fuel consumption using hybrid vehicles

with regenerative braking, vehicles equipped with Rankine-cycle engines, electric vehicles and fuel cell vehicles are eligible for advanced technology credits. Manufacturers shall use sound engineering judgment to determine the performance of the vehicle or engine with advanced technology. Advanced technology credits for vehicles or engines complying with Phase 1 standards may be increased by a 1.5 multiplier. Manufacturers may not apply this multiplier in addition to any early-credit multipliers. The maximum amount of credits a manufacturer may bring into the service class group that contains the heavy-duty pickup and van averaging set is $5.89 \cdot 10^6$ gallons (for advanced technology credits based upon compression-ignition engines) or $6.76 \cdot 10^6$ gallons (for advanced technology credits based upon spark-ignition engines) per model year as specified in 40 CFR part 86 for heavy-duty pickup trucks and vans, 40 CFR 1036.740 for engines and 40 CFR 1037.740 for tractors and vocational vehicles. The specified limit does not cap the amount of advanced technology credits that can be used across averaging sets within the same service class group. Advanced technology credits can be used to offset negative credits in the same averaging set or other averaging sets. A manufacturer must first apply advanced technology credits to any deficits in the same averaging set before applying them to other averaging.

(A) *Heavy-duty pickup trucks and vans.* For advanced technology systems (hybrid vehicles with regenerative braking, vehicles equipped with Rankine-cycle engines and fuel cell vehicles), calculate fleet-average performance rates consistent with good engineering judgment and the provisions of 40 CFR 86.1819–14 and 86.1865.

(B) *Tractors and vocational vehicles.* For advanced technology system (hybrid vehicles with regenerative braking, vehicles equipped with Rankine-cycle engines and fuel cell vehicles), calculate the advanced technology credits as follows:

(1) Measure the effectiveness of the advanced system by conducting A to B testing a vehicle equipped with the advanced system and an equivalent conventional system in accordance with 40 CFR 1037.615.

(2) For purposes of this paragraph (f), a conventional vehicle is considered to be equivalent if it has the same footprint, intended vehicle service class, aerodynamic drag, and other relevant factors not directly related to the advanced system powertrain. If there is no equivalent vehicle, the manufacturer

may create and test a prototype equivalent vehicle. The conventional vehicle is considered Vehicle A, and the advanced technology vehicle is considered Vehicle B.

(3) The benefit associated with the advanced system for fuel consumption is determined from the weighted fuel consumption results from the chassis tests of each vehicle using the following equation:

$$\text{Benefit (gallon/1000 ton mile)} = \text{Improvement Factor} \times \text{GEM Fuel Consumption Result}_B$$

Where:

$$\text{Improvement Factor} = (\text{Fuel Consumption}_A - \text{Fuel Consumption}_B) / (\text{Fuel Consumption}_A)$$

Fuel Consumption Rates A and B are the gallons per 1000 ton-mile of the conventional and advanced vehicles, respectively as measured under the test procedures specified by EPA. GEM Fuel Consumption Result B is the estimated gallons per 1000 ton-mile rate resulting from emission modeling of the advanced vehicle as specified in 40 CFR 1037.520 and § 535.6(b).

(4) Calculate the benefit in credits using the equation in paragraph (c) of this section and replacing the term (Std-FEL) with the benefit.

(5) For electric vehicles calculate the fuel consumption credits using an FEL of 0 g/1000 ton-mile.

(C) *Heavy-duty engines.* This section specifies how to generate advanced technology-specific fuel consumption credits for hybrid powertrains that include energy storage systems and regenerative braking (including regenerative engine braking) and for engines that include Rankine-cycle (or other bottoming cycle) exhaust energy recovery systems.

(1) Pre-transmission hybrid powertrains are those engine systems that include features that recover and store energy during engine motoring operation but not from the vehicle wheels. These powertrains are tested using the hybrid engine test procedures of 40 CFR part 1065 or using the post-transmission test procedures.

(2) Post-transmission hybrid powertrains are those powertrains that include features that recover and store energy from braking at the vehicle wheels. These powertrains are tested by simulating the chassis test procedure applicable for hybrid vehicles under 40 CFR 1037.550.

(3) Test engines that include Rankine-cycle exhaust energy recovery systems according to the test procedures specified in 40 CFR part 1036, subpart F, unless EPA approves the manufacturer's alternate procedures.

(D) *Credit calculation.* Calculate credits as specified in paragraph (c) of this section. Credits generated from engines and powertrains certified under this section may be used in other averaging sets as described in 40 CFR 1036.740(d).

(ii) There are no separate credit allowances for advanced technology vehicles in the Phase 2 program. Instead, vehicle families containing plug-in battery electric hybrids, all-electric, and fuel cell vehicles certifying to Phase 2 vocational and tractor standards may multiply credits by a multiplier of:

(A) 3.5 times for plug-in hybrid electric vehicles;

(B) 4.5 times for all-electric vehicles; and

(C) 5.5 times for fuel cell vehicles.

(D) Incentivized credits for vehicles equipped with advanced technologies maintain the same credit flexibilities and restrictions as conventional credits specified in paragraph (a) of this section during the Phase 2 program.

(E) For vocational vehicles and tractors subject to Phase 2 standards, create separate vehicle families if there is a credit multiplier for advanced technology; group those vehicles together in a vehicle family if they use the same multiplier.

(F) For Phase 2 plug-in hybrid electric vehicles and for fuel cells powered by any fuel other than hydrogen, calculate fuel consumption credits using an FEL based on equivalent emission measurements from powertrain testing. Phase 2 advanced-technology credits do not apply for hybrid vehicles that have no plug-in capability.

(2) *Innovative and off-cycle technology credits.* This provision allows fuel saving innovative and off-cycle engine and vehicle technologies to generate fuel consumption credits comparable to CO₂ emission credits consistent with the provisions of 40 CFR 86.1819–14(d)(13) (for heavy-duty pickup trucks and vans), 40 CFR 1036.610 (for engines), and 40 CFR 1037.610 (for vocational vehicles and tractors).

(i) For model years 2013 through 2020, manufacturers may generate innovative technology credits for introducing technologies that were not in-common use for heavy-duty tractor, vocational vehicles or engines before model year 2010 and that are not reflected in the EPA specified test procedures. Upon identification and joint approval with EPA, NHTSA will allow equivalent fuel consumption credits into its program to those allowed by EPA for manufacturers seeking to obtain innovative technology credits in

a given model year. Such credits must remain within the same regulatory subcategory in which the credits were generated. NHTSA will adopt fuel consumption credits depending upon whether—

(A) The technology has a direct impact upon reducing fuel consumption performance; and

(B) The manufacturer has provided sufficient information to make sound engineering judgments on the impact of the technology in reducing fuel consumption performance.

(ii) For model years 2021 and later, manufacturers may generate off-cycle technology credits for introducing technologies that are not reflected in the EPA specified test procedures. Upon identification and joint approval with EPA, NHTSA will allow equivalent fuel consumption credits into its program to those allowed by EPA for manufacturers seeking to obtain innovative technology credits in a given model year. Such credits must remain within the same regulatory subcategory in which the credits were generated. NHTSA will adopt fuel consumption credits depending upon whether—

(A) The technology meets paragraph (f)(2)(i)(A) and (B) of this section.

(B) For heavy-duty pickup trucks and vans, manufacturers using the 5-cycle test to quantify the benefit of a technology are not required to obtain approval from the agencies to generate results.

(iii) The following provisions apply to all innovative and off-cycle technologies:

(A) Technologies found to be defective, or identified as a part of NHTSA's safety defects program, and technologies that are not performing as intended will have the values of approved off-cycle credits removed from the manufacturer's credit balance.

(B) Approval granted for innovative and off-cycle technology credits under NHTSA's fuel efficiency program does not affect or relieve the obligation to comply with the Vehicle Safety Act (49 U.S.C. Chapter 301), including the "make inoperative" prohibition (49 U.S.C. 30122), and all applicable Federal motor vehicle safety standards issued thereunder (FMVSSs) (49 CFR part 571). In order to generate off-cycle or innovative technology credits manufacturers must state—

(1) That each vehicle equipped with the technology for which they are seeking credits will comply with all applicable FMVSS(s); and

(2) Whether or not the technology has a fail-safe provision. If no fail-safe provision exists, the manufacturer must explain why not and whether a failure

of the innovative technology would affect the safety of the vehicle.

(C) Manufacturers requesting approval for innovative technology credits are required to provide documentation in accordance with 40 CFR 86.1869–12, 1036.610, and 1037.610.

(D) Credits will be accepted on a one-for-one basis expressed in terms of gallons in comparison to those approved by EPA.

(E) For the heavy-duty pickup trucks and vans, the average fuel consumption will be calculated as a separate credit amount (rounded to the nearest whole number) using the following equation:

$$\text{Off-cycle FC credits} = (\text{CO}_2 \text{ Credit/CF}) \times 100 \times \text{Production} \times \text{VLM}$$

Where:

CO₂ Credits = the credit value in grams per mile determined in 40 CFR 86.1869–12(c)(3), (d)(1), (d)(2) or (d)(3).

CF = conversion factor, which for spark-ignition engines is 8,887 and for compression-ignition engines is 10,180.

Production = the total production volume for the applicable category of vehicles.

VLM = vehicle lifetime miles, which for 2b–3 vehicles shall be 150,000 for the Phase 2 program.

The term (CO₂ Credit/CF) should be rounded to the nearest 0.0001.

(F) NHTSA will not approve innovative technology credits for technology that is related to crash-avoidance technologies, safety critical systems or systems affecting safety-critical functions, or technologies designed for the purpose of reducing the frequency of vehicle crashes.

(iv) Manufacturers normally may not calculate off-cycle credits or improvement factors under this section for technologies represented by GEM, but the agencies may allow a manufacturer to do so by averaging multiple GEM runs for special technologies for which a single GEM run cannot accurately reflect in-use performance. For example, if a manufacturer use an idle-reduction technology that is effective 80 percent of the time, the agencies may allow a manufacturer to run GEM with the technology active and with it inactive, and then apply an 80% weighting factor to calculate the off-cycle credit or improvement factor. A may need to perform testing to establish proper weighting factors or otherwise quantify the benefits of the special technologies.

(v) A manufacturer may apply the off-cycle provisions of this paragraph (2) and 40 CFR 1037.610 to trailers as early as model year 2018 as follows:

(A) A manufacturer may account for weight reduction based on measured values instead of using the weight reductions specified in 40 CFR

1037.515. Quantify the weight reduction by measuring the weight of a trailer in a certified configuration and comparing it to the weight of an equivalent trailer without weight-reduction technologies. This qualifies as A to B testing this part. Use good engineering judgment to select an equivalent trailer representing a baseline configuration. Use the calculated weight reduction in the equation specified in 40 CFR 1037.515 to calculate the trailer's CO₂ emission rate and calculate an equivalent fuel consumption rate.

(B) If a manufacturer's off-cycle technology reduces emissions and fuel consumption in a way that is proportional to measured rates as described in 40 CFR 1037.610(b)(1), multiply the trailer's CO₂ fuel consumption rate by the appropriate improvement factor.

(C) If a manufacturer's off-cycle technology does not yield emission and fuel consumption reductions that are proportional to measured rates, as described in 40 CFR 1037.610(b)(2), calculate an adjusted CO₂ fuel consumption rate for trailers by subtracting the appropriate off-cycle credit.

(vi) *Carry-over Approval.*

Manufacturers may carry-over these credits into future model years as described below:

(A) For model years before 2021, manufacturers may continue to use an approved improvement factor or credit for any appropriate engine or vehicle family in future model years through 2020.

(B) For model years 2021 and later, manufacturers may not rely on an approval for model years before 2021. Manufacturers must separately request the agencies approval before applying an improvement factor or credit under this section for 2021 and later engines and vehicle, even if the agencies approve the improvement factor or credit for similar engine and vehicle models before model year 2021.

(C) The following restrictions also apply to manufacturers seeking to continue to carryover the improvement factor (not the credit value) if—

(1) The FEL is generated by GEM or 5-cycle testing;

(2) The technology is not changed or paired with any other off-cycle technology;

(3) The improvement factor only applies to approved vehicle or engine families;

(4) The agencies do not expect the technology to be incorporated into GEM at any point during the Phase 2 program; and

(D) The documentation to carryover credits that would primarily justify the difference in fuel efficiency between real world and compliance protocols is the same for both Phase 1 and Phase 2 compliance protocols. The agencies must approve the justification. If the agencies do not approve the justification, the manufacturer must recertify.

§ 535.8 Reporting and recordkeeping requirements.

(a) *General requirements.*

Manufacturers producing heavy-duty vehicles and engines applicable to fuel consumption standards in § 535.5, for each given model year, must submit the required information as specified in paragraphs (b) through (h) of this section.

(1) The information required by this part must be submitted by the deadlines specified in this section and must be based upon all the information and data available to the manufacturer 30 days before submitting information.

(2) Manufacturers must submit information electronically through the EPA database system as the single point of entry for all information required for this national program and both agencies will have access to the information. In special circumstances, data may not be able to be received electronically (*i.e.*, during database system development work). The agencies will inform manufacturer of the alternatives can be used for submitting information. The format for the required information will be specified by EPA in coordination with NHTSA.

(3) Manufacturers providing incomplete reports missing any of the required information or providing untimely reports are considered as not complying with standards (*i.e.*, if good-faith estimates of U.S.-directed production volumes for EPA certificates of conformity are not provided) and are liable to pay civil penalties in accordance with 49 U.S.C. 32912.

(4) Manufacturers certifying a vehicle or engine family using an FEL or FCL below the applicable fuel consumption standard as described in § 535.5 may choose not to generate fuel consumption credits for that family. In which case, the manufacturer is not required to submit reporting or keep the associated records described in this part for that family.

(5) Manufacturers must use good engineering judgment and provide comparable fuel consumption information to that of the information or data provided to EPA under 40 CFR 86.1865, 1036.250, 1036.730, 1036.825, 1037.250, 1037.730, and 1037.825.

(6) Any information that must be sent directly to NHTSA. In instances in which EPA has not created an electronic pathway to receive the information, the information should be sent through an electronic portal identified by NHTSA or through the NHTSA CAFE database (*i.e.*, information on fuel consumption credit transactions). If hardcopy documents must be sent, the information should be sent to the Associate Administrator of Enforcement at 1200 New Jersey Avenue, NVS-200, Office W45-306, SW., Washington, DC 20590.

(b) *Pre-model year reports.* Manufacturers producing heavy-duty pickup trucks and vans must submit reports in advance of the model year providing early estimates demonstrating how their fleet(s) would comply with GHG emissions and fuel consumption standards. Note, the agencies understand that early model year reports contain estimates that may change over the course of a model year and that compliance information manufacturers submit prior to the beginning of a new model year may not represent the final compliance outcome. The agencies view the necessity for requiring early model reports as a manufacturer's good faith projection for demonstrating compliance with emission and fuel consumption standards.

(1) *Report deadlines.* For model years 2013 and later, manufacturer of heavy-duty pickup trucks and vans complying with voluntary and mandatory standards must submit a pre-model year report for the given model year as early as the date of the manufacturer's annual certification preview meeting with EPA and NHTSA, or prior to submitting its first application for a certificate of conformity to EPA in accordance with 40 CFR 86.1819-14(d). For example, a manufacturer choosing to comply in model year 2014 could submit its pre-model year report during its precertification meeting which could occur before January 2, 2013, or could provide its pre-model year report any time prior to submitting its first application for certification for the given model year.

(2) *Contents.* Each pre-model year report must be submitted including the following information for each model year.

(i) A list of each unique subconfiguration in the manufacturer's fleet describing the make and model designations, attribute based-values (*i.e.*, GVWR, GCWR, Curb Weight and drive configurations) and standards;

(ii) The emission and fuel consumption fleet average standard

derived from the unique vehicle configurations;

(iii) The estimated vehicle configuration, test group and fleet production volumes;

(iv) The expected emissions and fuel consumption test group results and fleet average performance;

(v) If complying with MY 2013 fuel consumption standards, a statement must be provided declaring that the manufacturer is voluntarily choosing to comply early with the EPA and NHTSA programs. The manufacturers must also acknowledge that once selected, the decision cannot be reversed and the manufacturer will continue to comply with the fuel consumption standards for subsequent model years for all the vehicles it manufacturers in each regulatory category for a given model year;

(vi) If complying with MYs 2014, 2015 or 2016 fuel consumption standards, a statement must be provided declaring whether the manufacturer will use fixed or increasing standards in accordance with § 535.5(a). The manufacturer must also acknowledge that once selected, the decision cannot be reversed and the manufacturer must continue to comply with the same alternative for subsequent model years for all the vehicles it manufacturers in each regulatory category for a given model year;

(vii) If complying with MYs 2014 or 2015 fuel consumption standards, a statement must be provided declaring that the manufacturer is voluntarily choosing to comply with NHTSA's voluntary fuel consumption standards in accordance with § 535.5(a)(4). The manufacturers must also acknowledge that once selected, the decision cannot be reversed and the manufacturer will continue to comply with the fuel consumption standards for subsequent model years for all the vehicles it manufacturers in each regulatory category for a given model year;

(viii) The list of Class 2b and 3 incomplete vehicles (cab-complete or chassis complete vehicles) and the method used to certify these vehicles as complete pickups and vans identifying the most similar complete sister- or other complete vehicles used to derive the target standards and performance test results;

(ix) The list of Class 4 and 5 incomplete and complete vehicles and the method use to certify these vehicles as complete pickups and vans identifying the most similar complete or sister vehicles used to derive the target standards and performance test results;

(x) List of loose engines included in the heavy-duty pickup and van category

and the list of vehicles used to derive target standards and performance test results;

(xi) Copy of any notices a vehicle manufacturer sends to the engine manufacturer to notify the engine manufacturers that their engines are subject to emissions and fuel consumption standards and that it intends to use their engines in excluded vehicles;

(xii) A fuel consumption credit plan as specified § 535.7(a) identifying the manufacturers estimated credit balances, planned credit flexibilities (*i.e.*, credit balances, planned credit trading, innovative, advanced and early credits and etc.) and if needed a credit deficit plan demonstrating how it plans to resolve any credit deficits that might occur for a model year within a period of up to three model years after that deficit has occurred; and

(xiii) The supplemental information specified in paragraph (h) of this section.

Note to paragraph (b): NHTSA may also ask a manufacturer to provide additional information if necessary to verify compliance with the fuel consumption requirements of this section.

(c) *Applications for certificate of conformity.* Manufacturers producing vocational vehicles, tractors and heavy-duty engines are required to submit applications for certificates of conformity to EPA in accordance with 40 CFR 1036.205 and 1037.205 in advance of introducing vehicles for commercial sale. Applications contain early model year information demonstrating how manufacturers plan to comply with GHG emissions. For model years 2013 and later, manufacturers of vocational vehicles, tractors and engine complying with NHTSA's voluntary and mandatory standards must submit applications for certificates of conformity in accordance through the EPA database including both GHG emissions and fuel consumption information for each given model year.

(1) *Submission deadlines.*

Applications are primarily submitted in advance of the given model year to EPA but cannot be submitted any later than December 31 of the given model year.

(2) *Contents.* Each application for certificates of conformity submitted to EPA must include the following equivalent fuel consumption.

(i) Equivalent fuel consumption values for emissions CO₂ FCLs values used to certify each engine family in accordance with 40 CFR 1036.205(e). This provision applies only to manufacturers producing heavy-duty engines.

(ii) Equivalent fuel consumption values for emission CO₂ data engines used to comply with emission standards in 40 CFR 1036.108. This provision applies only to manufacturers producing heavy-duty engines.

(iii) Equivalent fuel consumption values for emissions CO₂ FELs values used to certify each vehicle families or subfamilies in accordance with 40 CFR 1037.205(k). This provision applies only to manufacturers producing vocational vehicles and tractors.

(iv) Report modeling results for ten configurations in terms of CO₂ emissions and equivalent fuel consumption results in accordance with 40 CFR 1037.205(o). Include modeling inputs and detailed descriptions of how they were derived. This provision applies only to manufacturers producing vocational vehicles and tractors.

(v) Credit plans including the fuel consumption credit plan described in § 535.7(a).

(3) *Additional supplemental information.* Manufacturers are required to submit additional information as specified in paragraph (h) of this section for the NHTSA program before or at the same time it submits its first application for a certificate of conformity to EPA. Under limited conditions, NHTSA may also ask a manufacturer to provide additional information directly to the Administrator if necessary to verify the fuel consumption requirements of this regulation.

(d) *End of the Year (EOY) and Final reports.* Heavy-duty vehicle and engine manufacturers participating in the ABT program are required to submit EOY and final reports containing information for NHTSA as specified in paragraph (d)(2) of this section and in accordance with 40 CFR 86.1865, 1036.730, and 1037.730. Only manufacturers without credit deficits may decide not to participate in the ABT or may waive the requirement to send an EOY report. The EOY and final reports are used to review a manufacturer's preliminary or final compliance information and to identify manufacturers that might have a credit deficit for the given model year. For model years 2013 and later, heavy-duty vehicle and engine manufacturers complying with NHTSA's voluntary and mandatory standards must submit EOY and final reports through the EPA database including both GHG emissions and fuel consumption information for each given model year.

(1) *Report deadlines.* (i) For model year 2013 and later, heavy-duty vehicle and engine manufacturers complying with NHTSA voluntary and mandatory standards must submit EOY reports

through the EPA database including both GHG emissions and fuel consumption information within 90 days after the end of the given model year and no later than March 31 of the next calendar year.

(ii) For model year 2013 and later, heavy-duty vehicle and engine manufacturers complying with NHTSA voluntary and mandatory standards must submit final reports through the EPA database including both GHG emissions and fuel consumption information within 270 days after the end of the given model year and no later than September 30 of the next calendar year.

(iii) A manufacturer may ask NHTSA and EPA to extend the deadline of a final report by up to 30 days. A manufacturer unable to provide, and requesting to omit an emissions rate or fuel consumption value from a final report must obtain approval from the agencies prior to the submission deadline of its final report.

(iv) If a manufacturer expects differences in the information reported between the EOY and the final year report specified in 40 CFR 1036.730 and 1037.730, it must provide the most up-to-date fuel consumption projections in its final report and identify the information as preliminary.

(v) If the manufacturer cannot provide any of the required fuel consumption information, it must state the specific reason for the insufficiency and identify the additional testing needed or explain what analytical methods are believed by the manufacturer will be necessary to eliminate the insufficiency and certify that the results will be available for the final report.

(2) *Contents.* Each EOY and final report must be submitted including the following fuel consumption information for each model year. EOY reports contain preliminary final estimates and final reports must include the manufacturer's final compliance information.

(i) Engine and vehicle family designations and averaging sets.

(ii) Engine and vehicle regulatory subcategory and fuel consumption standards including any alternative standards used.

(iii) Engine and vehicle family FCLs and FELs in terms of fuel consumption.

(iv) Production volumes for engines and vehicles.

(v) A summary as specified in paragraph (g)(7) of this section describing the vocational vehicles and vocational tractors that were exempted as heavy-duty off-road vehicles. This applies to manufacturers participating

and not participating in the ABT program.

(vi) A summary describing any advanced or innovative technology engines or vehicles including alternative fueled vehicles that were produced for the model year identifying the approaches used to determinate compliance and the production volumes.

(vii) A list of each unique subconfiguration included in a manufacturer's fleet of heavy-duty pickup trucks and vans identifying the attribute based-values (GVWR, GCWR, Curb Weight, and drive configurations) and standards. This provision applies only to manufacturers producing heavy-duty pickup trucks and vans.

(viii) The fuel consumption fleet average standard derived from the unique vehicle configurations. This provision applies only to manufacturers producing heavy-duty pickup trucks and vans.

(ix) The subconfiguration and test group production volumes. This provision applies only to manufacturers producing heavy-duty pickup trucks and vans.

(x) The fuel consumption test group results and fleet average performance. This provision applies only to manufacturers producing heavy-duty pickup trucks and vans.

(xi) Manufacturers may correct errors in EOY and final reports as follows:

(A) Manufacturers may correct any errors in their end-of-year report when preparing the final report, as long as manufacturers send us the final report by the time it is due.

(B) If manufacturers or the agencies determine within 270 days after the end of the model year that errors mistakenly decreased the manufacturer's balance of fuel consumption credits, manufacturers may correct the errors and recalculate the balance of its fuel consumption credits. Manufacturers may not make any corrections for errors that are determined more than 270 days after the end of the model year. If manufacturers report a negative balance of fuel consumption credits, NHTSA may disallow corrections under this paragraph (d)(2)(xi)(B).

(C) If manufacturers or the agencies determine any time that errors mistakenly increased its balance of fuel consumption credits, manufacturers must correct the errors and recalculate the balance of fuel consumption credits.

(xii) Under limited conditions, NHTSA may also ask a manufacturer to provide additional information directly to the Administrator if necessary to verify the fuel consumption requirements of this regulation.

(e) *Amendments to applications for certification.* At any time, a manufacturer modifies an application for certification in accordance with 40 CFR 1036.225 and 1037.225, it must submit GHG emissions changes with equivalent fuel consumption values for the information required in paragraphs (b) through (e) and (h) of this section.

(f) *Confidential information.* Manufacturers must submit a request for confidentiality with each electronic submission specifying any part of the for information or data in a report that it believes should be withheld from public disclosure as trade secret or other confidential business information. Information submitted to EPA should follow EPA guidelines for treatment of confidentiality. Requests for confidential treatment for information submitted to NHTSA must be filed in accordance with the requirements of 49 CFR part 512, including submission of a request for confidential treatment and the information for which confidential treatment is requested as specified by part 512. For any information or data requested by the manufacturer to be withheld under 5 U.S.C. 552(b)(4) and 49 U.S.C. 32910(c), the manufacturer shall present arguments and provide evidence in its request for confidentiality demonstrating that—

(1) The item is within the scope of 5 U.S.C. 552(b)(4) and 49 U.S.C. 32910(c);

(2) The disclosure of the information at issue would cause significant competitive damage;

(3) The period during which the item must be withheld to avoid that damage; and

(4) How earlier disclosure would result in that damage.

(g) *Additional required information.* The following additional information is required to be submitted through the EPA database. NHTSA reserves the right to ask a manufacturer to provide additional information if necessary to verify the fuel consumption requirements of this regulation.

(1) *Small businesses.* For model years 2013 through 2020, vehicles and engines produced by small business manufacturers meeting the criteria in 13 CFR 121.201 are exempted from the requirements of this part. Qualifying small business manufacturers must notify EPA and NHTSA Administrators before importing or introducing into U.S. commerce exempted vehicles or engines. This notification must include a description of the manufacturer's qualification as a small business under 13 CFR 121.201. Manufacturers must submit this notification to EPA, and EPA will provide the notification to NHTSA. The agencies may review a

manufacturer's qualification as a small business manufacturer under 13 CFR 121.201.

(2) *Emergency vehicles.* For model years 2021 and later, emergency vehicles produced by heavy-duty pickup truck and van manufacturers are exempted except those produced by manufacturers voluntarily complying with standards in § 535.5(a). Manufacturers must notify the agencies in writing if using the provisions in § 535.5(a) to produce exempted emergency vehicles in a given model year, either in the report specified in 40 CFR 86.1865 or in a separate submission.

(3) *Early introduction.* The provision applies to manufacturers seeking to comply early with the NHTSA's fuel consumption program prior to model year 2014. The manufacturer must send the request to EPA before submitting its first application for a certificate of conformity.

(4) *NHTSA voluntary compliance model years.* Manufacturers must submit a statement declaring whether the manufacturer chooses to comply voluntarily with NHTSA's fuel consumption standards for model years 2014 through 2015. The manufacturers must acknowledge that once selected, the decision cannot be reversed and the manufacturer will continue to comply with the fuel consumption standards for subsequent model years. The manufacturer must send the statement to EPA before submitting its first application for a certificate of conformity.

(5) *Alternative engine standards.* Manufacturers choosing to comply with the alternative engine standards must notify EPA and NHTSA of their choice and include in that notification a demonstration that it has exhausted all available credits and credit opportunities. The manufacturer must send the statement to EPA before submitting its EOY report.

(6) *Alternate phase-in.* Manufacturers choosing to comply with the alternative engine phase-in must notify EPA and NHTSA of their choice. The manufacturer must send the statement to EPA before submitting its first application for a certificate of conformity.

(7) *Off-road exclusion (tractors and vocational vehicles only).* (i) Tractors and vocational vehicles primarily designed to perform work in off-road environments such as forests, oil fields, and construction sites may be exempted without request from the requirements of this regulation as specified in 49 CFR 523.2 and § 535.5(b). Within 90 days after the end of each model year,

manufacturers must send EPA and NHTSA through the EPA database a report with the following information:

(A) A description of each excluded vehicle configuration, including an explanation of why it qualifies for this exclusion.

(B) The number of vehicles excluded for each vehicle configuration.

(ii) A manufacturer having an off-road vehicle failing to meet the criteria under the agencies' off-road exclusions will be allowed to request an exclusion of such a vehicle from EPA and NHTSA. The approval will be granted through the certification process for the vehicle family and will be done in collaboration between EPA and NHTSA in accordance with the provisions in 40 CFR 1037.150, 1037.210, and 1037.631.

(8) *Vocational tractors.* Tractors intended to be used as vocational tractors may comply with vocational vehicle standards in § 535.5(b). Manufacturers classifying tractors as vocational tractors must provide a description of how they meet the qualifications in their applications for certificates of conformity as specified in 40 CFR 1037.205.

(9) *Approval of alternate methods to determine drag coefficients (tractors only).* Manufacturers seeking to use alternative methods to determine aerodynamic drag coefficients must provide a request and gain approval by EPA in accordance with 40 CFR 1037.525. The manufacturer must send the request to EPA before submitting its first application for a certificate of conformity.

(10) *Innovative and off-cycle technology credits.* Manufacturers pursuing innovative and off-cycle technology credits must submit information to the agencies and may be subject to a public evaluation process in which the public would have opportunity for comment if the manufacturer is not using a test procedure in accordance with 40 CFR 1037.610(c). Whether the approach involves on-road testing, modeling, or some other analytical approach, the manufacturer would be required to present a final methodology to EPA and NHTSA. EPA and NHTSA would approve the methodology and credits only if certain criteria were met. Baseline emissions and fuel consumption and control emissions and fuel consumption would need to be clearly demonstrated over a wide range of real world driving conditions and over a sufficient number of vehicles to address issues of uncertainty with the data. Data would need to be on a vehicle model-specific basis unless a manufacturer demonstrated model-

specific data was not necessary. The agencies may publish a notice of availability in the **Federal Register** notifying the public of a manufacturer's proposed alternative off-cycle credit calculation methodology and provide opportunity for comment. Any notice will include details regarding the methodology, but not include any Confidential Business Information.

(11) *Credit trades.* If a manufacturer trades fuel consumption credits, it must send EPA and NHTSA a fuel consumption credit plan as specified in § 535.7(a) and provide the following additional information:

(i) As the seller, the manufacturer must include the following information:
(A) The corporate names of the buyer and any brokers.

(B) A copy of any contracts related to the trade.

(C) The averaging set corresponding to the engine families that generated fuel consumption credits for the trade, including the number of fuel consumption credits from each averaging set.

(ii) As the buyer, the manufacturer or entity must include the following information in its report:

(A) The corporate names of the seller and any brokers.

(B) A copy of any contracts related to the trade.

(C) How the manufacturer or entity intends to use the fuel consumption credits, including the number of fuel consumption credits it intends to apply for each averaging set.

(D) A copy of the contract with signatures from both the buyer and the seller.

(12) *Production reports.* Within 90 days after the end of the model year and no later than March 31st, manufacturers participating and not-participating in the ABT program must send to EPA and NHTSA a report including the total U.S.-directed production volume of vehicles it produced in each vehicle and engine family during the model year (based on information available at the time of the report) as required by 40 CFR 1036.250 and 1037.250. Trailer manufacturers must include a separate report including the total U.S.-directed production volume of excluded trailers as allowed by § 535.3(e). Each manufacturer shall report by vehicle or engine identification number and by configuration and identify the subfamily identifier. Report uncertified vehicles sold to secondary vehicle manufacturers. Small business manufacturers may omit reporting. Identify any differences between volumes included for EPA but excluded for NHTSA.

(13) *Transition to engine-based model years.* The following provisions apply for production and ABT reports during the transition to engine-based model year determinations for tractors and vocational vehicles in 2020 and 2021:

(i) If a manufacturer installs model year 2020 or earlier engines in the manufacturer's vehicles in calendar year 2020, include all those Phase 1 vehicles in its production and ABT reports related to model year 2020 compliance, although the agencies may require the manufacturer to identify these separately from vehicles produced in calendar year 2019.

(ii) If a manufacturer installs model year 2020 engines in its vehicles in calendar year 2021, submit production and ABT reports for those Phase 1 vehicles separate from the reports it submits for Phase 2 vehicles with model year 2021 engines.

(h) *Public information.* Based upon information submitted by manufacturers and EPA, NHTSA will publish fuel consumption standards and performance results.

(i) *Information received from EPA.* NHTSA will receive information from EPA as specified in 40 CFR 1036.755 and 1037.755.

(j) *Recordkeeping.* NHTSA has the same recordkeeping requirements as the EPA, specified in 40 CFR 86.1865–12(k), 1036.250, 1036.735, 1036.825, 1037.250, 1037.735, and 1037.825. The agencies each reserve the right to request information contained in reports separately.

(1) Manufacturers must organize and maintain records for NHTSA as described in this section. NHTSA in conjunction or separately from EPA may review a manufacturers records at any time.

(2) Keep the records required by this section for at least eight years after the due date for the end-of-year report. Manufacturers may not use fuel consumption credits for any engines if it does not keep all the records required under this section. Manufacturers must therefore keep these records to continue to bank valid credits. Store these records in any electronic format and on any media, as long as the manufacturer can promptly send the agencies organized records in English if the agencies ask for them. Manufacturers must keep these records readily available. NHTSA may review them at any time.

(3) Keep a copy of the reports required in § 535.8 and 40 CFR 1036.725, 1036.730, 1037.725 and 1037.730.

(4) Keep records of the vehicles and engine identification number (usually the serial number) for each vehicle and

engine produced that generates or uses fuel consumption credits under the ABT program. Manufacturers may identify these numbers as a range. If manufacturers change the FEL after the start of production, identify the date started using each FEL/FCL and the range of vehicles or engine identification numbers associated with each FEL/FCL. Manufacturers must also identify the purchaser and destination for each vehicle and engine produced to the extent this information is available.

(5) The agencies may require manufacturers to keep additional records or to send relevant information not required by this section in accordance with each agency's authority.

(6) If collected separately and NHTSA finds that information is provided fraudulent or grossly negligent or otherwise provided in bad faith, the manufacturer may be liable to civil penalties in accordance with each agency's authority.

§ 535.9 Enforcement approach.

(a) *Compliance.* (1) Each year NHTSA will assess compliance with fuel consumption standards as specified in § 535.10.

(i) NHTSA may conduct audits or verification testing prior to first sale throughout a given model year or after the model year in order to validate data received from manufacturers and will discuss any potential issues with EPA and the manufacturer. Audits may periodically be performed to confirm manufacturers credit balances or other credit transactions.

(ii) NHTSA may also conduct field inspections either at manufacturing plants or at new vehicle dealerships to validate data received from manufacturers. Field inspections will be carried out in order to validate the condition of vehicles, engines or technology prior to first commercial sale to verify each component's certified configuration as initially built. NHTSA reserves the right to conduct inspections at other locations but will target only those components for which a violation would apply to OEMs and not the fleets or vehicle owners. Compliance inspections could be carried out through a number of approaches including during safety inspections or during compliance safety testing.

(iii) NHTSA will conduct audits and inspections in the same manner and, when possible, in conjunction with EPA. NHTSA will also attempt to coordinate inspections with EPA and share results.

(iv) Documents collected under NHTSA safety authority may be used to

support fuel efficiency audits and inspections.

(2) At the end of each model year NHTSA will confirm a manufacturer's fleet or family performance values against the applicable standards and, if a manufacturer uses a credit flexibility, the amount of credits in each averaging set. The averaging set balance is based upon the engines or vehicles performance above or below the applicable regulatory subcategory standards in each respective averaging set and any credits that are traded into or out of an averaging set during the model year.

(i) If the balance is positive, the manufacturer is designated as having a credit surplus.

(ii) If the balance is negative, the manufacturer is designated as having a credit deficit.

(iii) NHTSA will provide notification to each manufacturer confirming its credit balance(s) after the end of each model year directly or through EPA.

(3) Manufacturer are required to confirm the negative balance and submit a fuel consumption credit plan as specified in § 535.7(a) along with supporting documentation indicating how it will allocate existing credits or earn (providing information on future vehicles, engines or technologies), and/or acquire credits, or else be liable for a civil penalty as determined in paragraph (b) of this section. The manufacturer must submit the information within 60 days of receiving agency notification.

(4) Credit shortfall within an averaging set may be carried forward only three years, and if not offset by earned or traded credits, the manufacturer may be liable for a civil penalty as described in paragraph (b) of this section.

(5) Credit allocation plans received from a manufacturer will be reviewed and approved by NHTSA. NHTSA will approve a credit allocation plan unless it determines that the proposed credits are unavailable or that it is unlikely that the plan will result in the manufacturer earning or acquiring sufficient credits to offset the subject credit shortfall. In the case where a manufacturer submits a plan to acquire future model year credits earned by another manufacturer, NHTSA will require a signed agreement by both manufacturers to initiate a review of the plan. If a plan is approved, NHTSA will revise the respective manufacturer's credit account accordingly by identifying which existing or traded credits are being used to address the credit shortfall, or by identifying the manufacturer's plan to earn future credits for addressing the

respective credit shortfall. If a plan is rejected, NHTSA will notify the respective manufacturer and request a revised plan. The manufacturer must submit a revised plan within 14 days of receiving agency notification. The agency will provide a manufacturer one opportunity to submit a revised credit allocation plan before it initiates civil penalty proceedings.

(6) For purposes of this regulation, NHTSA will treat the use of future credits for compliance, as through a credit allocation plan, as a deferral of civil penalties for non-compliance with an applicable fuel consumption standard.

(7) If NHTSA receives and approves a manufacturer's credit allocation plan to earn future credits within the following three model years in order to comply with regulatory obligations, NHTSA will defer levying civil penalties for non-compliance until the date(s) when the manufacturer's approved plan indicates that credits will be earned or acquired to achieve compliance, and upon receiving confirmed CO₂ emissions and fuel consumption data from EPA. If the manufacturer fails to acquire or earn sufficient credits by the plan dates, NHTSA will initiate civil penalty proceedings.

(8) In the event that NHTSA fails to receive or is unable to approve a plan for a non-compliant manufacturer due to insufficiency or untimeliness, NHTSA may initiate civil penalty proceedings.

(9) In the event that a manufacturer fails to report accurate fuel consumption data for vehicles or engines covered under this rule, noncompliance will be assumed until corrected by submission of the required data, and NHTSA may initiate civil penalty proceedings.

(10) If EPA suspends or revoke a certificate of conformity as specified in 40 CFR 1036.255 or 1037.255, and a manufacturer is unable to take a corrective action allowed by EPA, noncompliance will be assumed, and NHTSA may initiate civil penalty proceedings or revoke fuel consumption credits.

(b) *Civil penalties*—(1) *Generally.* NHTSA may assess a civil penalty for any violation of this part under 49 U.S.C. 32902(k). This section states the procedures for assessing civil penalties for violations of § 535.3(h). The provisions of 5 U.S.C. 554, 556, and 557 do not apply to any proceedings conducted pursuant to this section.

(2) *Initial determination of noncompliance.* An action for civil penalties is commenced by the execution of a Notice of Violation. A determination by NHTSA's Office of

Enforcement of noncompliance with applicable fuel consumption standards utilizing the certified and reported CO₂ emissions and fuel consumption data provided by the Environmental Protection Agency as described in this part, and after considering all the flexibilities available under § 535.7, underlies a Notice of Violation. If NHTSA Enforcement determines that a manufacturer's averaging set of vehicles or engines fails to comply with the applicable fuel consumption standard(s) by generating a credit shortfall, the incomplete vehicle, complete vehicle or engine manufacturer, as relevant, shall be subject to a civil penalty.

(3) *Numbers of violations and maximum civil penalties.* Any violation shall constitute a separate violation with respect to each vehicle or engine within the applicable regulatory averaging set. The maximum civil penalty is not more than \$37,500.00 per vehicle or engine. The maximum civil penalty under this section for a related series of violations shall be determined by multiplying \$37,500.00 times the vehicle or engine production volume for the model year in question within the regulatory averaging set. NHTSA may adjust this civil penalty amount to account for inflation.

(4) *Factors for determining penalty amount.* In determining the amount of any civil penalty proposed to be assessed or assessed under this section, NHTSA shall take into account the gravity of the violation, the size of the violator's business, the violator's history of compliance with applicable fuel consumption standards, the actual fuel consumption performance related to the applicable standards, the estimated cost to comply with the regulation and applicable standards, the quantity of vehicles or engines not complying, and the effect of the penalty on the violator's ability to continue in business. The "estimated cost to comply with the regulation and applicable standards," will be used to ensure that penalties for non-compliance will not be less than the cost of compliance.

(5) *NHTSA enforcement report of determination of non-compliance.* (i) If NHTSA Enforcement determines that a violation has occurred, NHTSA Enforcement may prepare a report and send the report to the NHTSA Chief Counsel.

(ii) The NHTSA Chief Counsel will review the report prepared by NHTSA Enforcement to determine if there is sufficient information to establish a likely violation.

(iii) If the Chief Counsel determines that a violation has likely occurred, the

Chief Counsel may issue a Notice of Violation to the party.

(iv) If the Chief Counsel issues a Notice of Violation, he or she will prepare a case file with recommended actions. A record of any prior violations by the same party shall be forwarded with the case file.

(6) *Notice of violation.* (i) The Notice of Violation will contain the following information:

(A) The name and address of the party;

(B) The alleged violation(s) and the applicable fuel consumption standard(s) violated;

(C) The amount of the proposed penalty and basis for that amount;

(D) The place to which, and the manner in which, payment is to be made;

(E) A statement that the party may decline the Notice of Violation and that if the Notice of Violation is declined within 30 days of the date shown on the Notice of Violation, the party has the right to a hearing, if requested within 30 days of the date shown on the Notice of Violation, prior to a final assessment of a penalty by a Hearing Officer; and

(F) A statement that failure to either pay the proposed penalty or to decline the Notice of Violation and request a hearing within 30 days of the date shown on the Notice of Violation will result in a finding of violation by default and that NHTSA will proceed with the civil penalty in the amount proposed on the Notice of Violation without processing the violation under the hearing procedures set forth in this subpart.

(ii) The Notice of Violation may be delivered to the party by—

(A) Mailing to the party (certified mail is not required);

(B) Use of an overnight or express courier service; or

(C) Facsimile transmission or electronic mail (with or without attachments) to the party or an employee of the party.

(iii) At any time after the Notice of Violation is issued, NHTSA and the party may agree to reach a compromise on the payment amount.

(iv) Once a penalty amount is paid in full, a finding of "resolved with payment" will be entered into the case file.

(v) If the party agrees to pay the proposed penalty, but has not made payment within 30 days of the date shown on the Notice of Violation, NHTSA will enter a finding of violation by default in the matter and NHTSA will proceed with the civil penalty in the amount proposed on the Notice of Violation without processing the

violation under the hearing procedures set forth in this subpart.

(vi) If within 30 days of the date shown on the Notice of Violation a party fails to pay the proposed penalty on the Notice of Violation, and fails to request a hearing, then NHTSA will enter a finding of violation by default in the case file, and will assess the civil penalty in the amount set forth on the Notice of Violation without processing the violation under the hearing procedures set forth in this subpart.

(vii) NHTSA's order assessing the civil penalty following a party's default is a final agency action.

(7) *Hearing Officer.* (i) If a party timely requests a hearing after receiving a Notice of Violation, a Hearing Officer shall hear the case.

(ii) The Hearing Officer will be appointed by the NHTSA Administrator, and is solely responsible for the case referred to him or her. The Hearing Officer shall have no other responsibility, direct or supervisory, for the investigation of cases referred for the assessment of civil penalties. The Hearing Officer shall have no duties related to the light-duty fuel economy or medium- and heavy-duty fuel efficiency programs.

(iii) The Hearing Officer decides each case on the basis of the information before him or her.

(8) *Initiation of action before the Hearing Officer.* (i) After the Hearing Officer receives the case file from the Chief Counsel, the Hearing Officer notifies the party in writing of—

(A) The date, time, and location of the hearing and whether the hearing will be conducted telephonically or at the DOT Headquarters building in Washington, DC;

(B) The right to be represented at all stages of the proceeding by counsel as set forth in paragraph (b)(9) of this section; and

(C) The right to a free copy of all written evidence in the case file.

(ii) On the request of a party, or at the Hearing Officer's direction, multiple proceedings may be consolidated if at any time it appears that such consolidation is necessary or desirable.

(9) *Counsel.* A party has the right to be represented at all stages of the proceeding by counsel. A party electing to be represented by counsel must notify the Hearing Officer of this election in writing, after which point the Hearing Officer will direct all further communications to that counsel. A party represented by counsel bears all of its own attorneys' fees and costs.

(10) *Hearing location and costs.* (i) Unless the party requests a hearing at which the party appears before the

Hearing Officer in Washington, DC, the hearing may be held telephonically. In Washington, DC, the hearing is held at the headquarters of the U.S. Department of Transportation.

(ii) The Hearing Officer may transfer a case to another Hearing Officer at a party's request or at the Hearing Officer's direction.

(iii) A party is responsible for all fees and costs (including attorneys' fees and costs, and costs that may be associated with travel or accommodations) associated with attending a hearing.

(11) *Hearing procedures.* (i) There is no right to discovery in any proceedings conducted pursuant to this subpart.

(ii) The material in the case file pertinent to the issues to be determined by the Hearing Officer is presented by the Chief Counsel or his or her designee.

(iii) The Chief Counsel may supplement the case file with information prior to the hearing. A copy of such information will be provided to the party no later than three business days before the hearing.

(iv) At the close of the Chief Counsel's presentation of evidence, the party has the right to examine, respond to, and rebut material in the case file and other information presented by the Chief Counsel. In the case of witness testimony, both parties have the right of cross-examination.

(v) In receiving evidence, the Hearing Officer is not bound by strict rules of evidence. In evaluating the evidence presented, the Hearing Officer must give due consideration to the reliability and relevance of each item of evidence.

(vi) At the close of the party's presentation of evidence, the Hearing Officer may allow the introduction of rebuttal evidence that may be presented by the Chief Counsel.

(vii) The Hearing Officer may allow the party to respond to any rebuttal evidence submitted.

(viii) After the evidence in the case has been presented, the Chief Counsel and the party may present arguments on the issues in the case. The party may also request an opportunity to submit a written statement for consideration by the Hearing Officer and for further review. If granted, the Hearing Officer shall allow a reasonable time for submission of the statement and shall specify the date by which it must be received. If the statement is not received within the time prescribed, or within the limits of any extension of time granted by the Hearing Officer, it need not be considered by the Hearing Officer.

(ix) A verbatim transcript of the hearing will not normally be prepared. A party may, solely at its own expense,

cause a verbatim transcript to be made. If a verbatim transcript is made, the party shall submit two copies to the Hearing Officer not later than 15 days after the hearing. The Hearing Officer shall include such transcript in the record.

(12) *Determination of violations and assessment of civil penalties.* (i) Not later than 30 days following the close of the hearing, the Hearing Officer shall issue a written decision on the Notice of Violation, based on the hearing record. This may be extended by the Hearing Officer if the submissions by the Chief Counsel or the party are voluminous. The decision shall address each alleged violation, and may do so collectively. For each alleged violation, the decision shall find a violation or no violation and provide a basis for the finding. The decision shall set forth the basis for the Hearing Officer's assessment of a civil penalty, or decision not to assess a civil penalty. In determining the amount of the civil penalty, the gravity of the violation, the size of the violator's business, the violator's history of compliance with applicable fuel consumption standards, the actual fuel consumption performance related to the applicable standard, the estimated cost to comply with the regulation and applicable standard, the quantity of vehicles or engines not complying, and the effect of the penalty on the violator's ability to continue in business. The assessment of a civil penalty by the Hearing Officer shall be set forth in an accompanying final order. The Hearing Officer's written final order is a final agency action.

(ii) If the Hearing Officer assesses civil penalties in excess of \$1,000,000, the Hearing Officer's decision shall contain a statement advising the party of the right to an administrative appeal to the Administrator within a specified period of time. The party is advised that failure to submit an appeal within the prescribed time will bar its consideration and that failure to appeal on the basis of a particular issue will constitute a waiver of that issue in its appeal before the Administrator.

(iii) The filing of a timely and complete appeal to the Administrator of a Hearing Officer's order assessing a civil penalty shall suspend the operation of the Hearing Officer's penalty, which shall no longer be a final agency action.

(iv) There shall be no administrative appeals of civil penalties assessed by a Hearing Officer of less than \$1,000,000.

(13) *Appeals of civil penalties in excess of \$1,000,000.* (i) A party may appeal the Hearing Officer's order assessing civil penalties over \$1,000,000

to the Administrator within 21 days of the date of the issuance of the Hearing Officer's order.

(ii) The Administrator will review the decision of the Hearing Officer de novo, and may affirm the decision of the hearing officer and assess a civil penalty, or

(iii) The Administrator may—

(A) Modify a civil penalty;
(B) Rescind the Notice of Violation; or
(C) Remand the case back to the Hearing Officer for new or additional proceedings.

(iv) In the absence of a remand, the decision of the Administrator in an appeal is a final agency action.

(14) *Collection of assessed or compromised civil penalties.* (i) Payment of a civil penalty, whether assessed or compromised, shall be made by check, postal money order, or electronic transfer of funds, as provided in instructions by the agency. A payment of civil penalties shall not be considered a request for a hearing.

(ii) The party must remit payment of any assessed civil penalty to NHTSA within 30 days after receipt of the Hearing Officer's order assessing civil penalties, or, in the case of an appeal to the Administrator, within 30 days after receipt of the Administrator's decision on the appeal.

(iii) The party must remit payment of any compromised civil penalty to NHTSA on the date and under such terms and conditions as agreed to by the party and NHTSA. Failure to pay may result in NHTSA entering a finding of violation by default and assessing a civil penalty in the amount proposed in the Notice of Violation without processing the violation under the hearing procedures set forth in this part.

(c) *Changes in corporate ownership and control.* Manufacturers must inform NHTSA of corporate relationship changes to ensure that credit accounts are identified correctly and credits are assigned and allocated properly.

(1) In general, if two manufacturers merge in any way, they must inform NHTSA how they plan to merge their credit accounts. NHTSA will subsequently assess corporate fuel consumption and compliance status of the merged fleet instead of the original separate fleets.

(2) If a manufacturer divides or divests itself of a portion of its automobile manufacturing business, it must inform NHTSA how it plans to divide the manufacturer's credit holdings into two or more accounts. NHTSA will subsequently distribute holdings as directed by the manufacturer, subject to provision for

reasonably anticipated compliance obligations.

(3) If a manufacturer is a successor to another manufacturer's business, it must inform NHTSA how it plans to allocate credits and resolve liabilities per 49 CFR part 534.

§ 535.10 How do manufacturers comply with fuel consumption standards?

(a) *Pre-certification process.* (1) Regulated manufacturers determine eligibility to use exemptions or exclusions in accordance with § 535.3.

(2) Manufacturers may seek preliminary approvals as specified in 40 CFR 1036.210 and 40 CFR 1037.210 from EPA and NHTSA, if needed. Manufacturers may request to schedule pre-certification meetings with EPA and NHTSA prior to submitting approval requests for certificates of conformity to address any joint compliance issues and gain informal feedback from the agencies.

(3) The requirements and prohibitions required by EPA in special circumstances in accordance with 40 CFR 1037.601 and 40 CFR part 1068 apply to manufacturers for the purpose of complying with fuel consumption standards. Manufacturers should use good judgment when determining how EPA requirements apply in complying with the NHTSA program. Manufacturers may contact NHTSA and EPA for clarification about how these requirements apply to them.

(4) In circumstances in which EPA provides multiple compliance approaches manufacturers must choose the same compliance path to comply with NHTSA's fuel consumption standards that they choose to comply with EPA's greenhouse gas emission standards.

(5) Manufacturers may not introduce new vehicles into commerce without a certificate of conformity from EPA. Manufacturers must attest to several compliance standards in order to obtain a certificate of conformity. This includes stating comparable fuel consumption results for all required CO₂ emissions rates. Manufacturers not completing these steps do not comply with the NHTSA fuel consumption standards.

(6) Manufacturers apply the fuel consumption standards specified in § 535.5 to vehicles, engines and components that represent production units and components for vehicle and engine families, sub-families and configurations consistent with the EPA specifications in 40 CFR 86.1819, 1036.230, and 1037.230.

(7) Only certain vehicles and engines are allowed to comply differently between the NHTSA and EPA programs

as detailed in this section. These vehicles and engines must be identified by manufacturers in the ABT and production reports required in § 535.8.

(b) *Model year compliance.* Manufacturers are required to conduct testing to demonstrate compliance with CO₂ exhaust emissions standards in accordance with EPA's provisions in 40 CFR part 600, subpart B, 40 CFR 1036, subpart F, 40 CFR part 1037, subpart R, and 40 CFR part 1066. Manufacturers determine equivalent fuel consumption performance values for CO₂ results as specified in § 535.6 and demonstrate compliance by comparing equivalent results to the applicable fuel consumption standards in § 535.5.

(c) *End-of-the-year process.* Manufacturers comply with fuel consumption standards after the end of each model year, if—

(1) For heavy-duty pickup trucks and vans, the manufacturer's fleet average performance, as determined in § 535.6, is less than the fleet average standard; or

(2) For truck tractors, vocational vehicles, engines and box trailers the manufacturer's fuel consumption performance for each vehicle or engine family (or sub-family), as determined in § 535.6, is lower than the applicable regulatory subcategory standards in § 535.5.

(3) For non-box and non-aero trailers, a manufacturer is considered in compliance with fuel consumption standards if all trailers meet the specified standards in § 535.5(e)(1)(i).

(4) NHTSA will use the EPA final verified values as specified in 40 CFR 86.1819, 40 CFR 1036.755, and 1037.755 for making final determinations on whether vehicles and engines comply with fuel consumption standards.

(5) A manufacturer fails to comply with fuel consumption standards if its final reports are not provided in accordance with § 535.8 and 40 CFR 86.1865, 1036.730, and 1037.730. Manufacturers not providing complete or accurate final reports or any plans by the required deadlines do not comply with fuel consumption standards. A manufacturer that is unable to provide any emissions results along with comparable fuel consumption values must obtain permission for EPA to exclude the results prior to the deadline for submitting final reports.

(6) A manufacturer that would otherwise fail to directly comply with fuel consumption standards as described in paragraphs (c)(1) through (3) of this section may use one or more of the credit flexibilities provided under the NHTSA averaging, banking and trading program, as specified in § 535.7,

but must offset all credit deficits in its averaging sets to achieve compliance.

(7) A manufacturer failing to comply with the provisions specified in this part may be liable to pay civil penalties in accordance with § 535.9.

(8) A manufacturer may also be liable to pay civil penalties if found by EPA or NHTSA to have provided false information as identified through NHTSA or EPA enforcement audits or new vehicle verification testing as specified in § 535.9 and 40 CFR parts 86, 1036, and 1037.

PART 538—MANUFACTURING INCENTIVES FOR ALTERNATIVE FUEL VEHICLES

■ 382. Revise the authority citation for part 538 to read as follows:

Authority: 49 U.S.C. 32901, 32905, and 32906; delegation of authority at 49 CFR 1.95.

■ 383. Revise § 538.5 to read as follows:

§ 538.5 Minimum driving range.

(a) The minimum driving range that a passenger automobile must have in order to be treated as a dual fueled automobile pursuant to 49 U.S.C. 32901(c) is 200 miles when operating on its nominal useable fuel tank capacity of the alternative fuel, except when the alternative fuel is electricity or compressed natural gas. Beginning model year 2016, a natural gas passenger automobile must have a minimum driving range of 150 miles when operating on its nominal useable fuel tank capacity of the alternative fuel to be treated as a dual fueled automobile, pursuant to 49 U.S.C. 32901(c)(2).

(b) The minimum driving range that a passenger automobile using electricity as an alternative fuel must have in order to be treated as a dual fueled automobile pursuant to 49 U.S.C. 32901(c) is 7.5 miles on its nominal storage capacity of electricity when operated on the EPA urban test cycle and 10.2 miles on its nominal storage capacity of electricity when operated on the EPA highway test cycle.

Dated: August 16, 2016.

Anthony Foxx,

Secretary, Department of Transportation.

Dated: August 16, 2016.

Gina McCarthy,

Administrator, Environmental Protection Agency.

Re: Request to Reconsider and Stay Phase 2 GHG and Fuel Efficiency Standards for Truck Trailers

Dear Administrator Pruitt and Secretary Chao:

I am writing to request your immediate intervention to resolve a pending petition filed by the Truck Trailer Manufacturers Association (TTMA) in the US Court of Appeals for the District of Columbia Circuit to review the greenhouse gas fuel economy standards for heavy-duty truck trailers. TTMA's members manufacture nearly all of the heavy-duty truck trailers sold and operated in the United States. We represent over 70 trailer manufacturers with offices and plants located in over 33 states. Most of these manufacturing companies are closely-held, family-owned businesses. Our members' customers comprise cargo shippers and motor carrier fleets, large and small, as well as independent owner-operators, who together move nearly all of the nation's commercial truck freight.

The new greenhouse gas standards unlawfully treat trailers as "motor vehicles" and unwisely mandate installation of aerodynamic equipment on the vast majority of trailers, regardless of actual use. Because the industry already installs this equipment in those uses where it saves fuel, the standards will substantially burden the motor carrier industry and produce little or no additional greenhouse gas or fuel economy gain. Moreover, we believe that the President's March 28, 2017 Executive Order requiring review and, as appropriate, suspension, revision or rescission of actions arising from President Obama's June 2013 Climate Action plan directly applies to these standards. We therefore ask that EPA and NHTSA review, reconsider and begin a process to rescind these standards. We further ask EPA and NHTSA to take steps to suspend or stay the effectiveness of the standards in the interim, due to the burden of imminent steps that trailer manufacturers otherwise must take to comply. We ask to meet with you or your designees at your earliest convenience to address this matter, which is urgent for our members, their employees and customers.

* * *

1. *The Standards.* On October 25, 2016, EPA and NHTSA promulgated “Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2” (GHGP2), which the agencies expressly described as having been “called for” in the 2013 Climate Action Plan. 81 Fed. Reg. 73,478, 73,480 (Oct. 25, 2016). Beginning with 2018 trailer production, the new GHGP2 standards will mandate installation of side skirts, trailer tails, low-rolling resistance tires and tire monitoring/inflation systems on most trailers manufactured and sold in the United States by TTMA’s members. Trailer manufacturers must install and sell this equipment even if the trucking operations of their customers will not achieve any fuel economy benefits (such as circumstances in which the trailers will not be hauled over long distances at highway speeds sufficient to produce any benefits).

2. *Petition for Review and Deficiencies in Rule.* On December 22, 2016, TTMA petitioned for review of the trailer standards in the United States Court of Appeals for the District of Columbia Circuit (Case No. 16-1430). TTMA intends to raise several objections to the rule:

The agencies lack statutory authority. EPA’s authority under the Clean Air Act to set standards for mobile sources is limited to engines and “motor vehicles,” defined in the statute to mean “self-propelled vehicle[s] designed for transporting persons or property on a street or highway.” 42 U.S.C. § 7550(2). Trailers are not self-propelled. Trailers are not equipped with engines that provide the power needed to transport cargo and thereby consume fuel or cause air emissions. EPA’s contention that trailers are part of the motor vehicle tractor-trailer combination makes no sense. Tractors and trailers are manufactured and sold separately by different sets of manufacturers to customer populations that are not the same; a single trailer is likely to be hauled by multiple tractors during its lifetime and, conversely, a single tractor is likely to haul multiple trailers. Moreover, in the nearly fifty years since EPA has been regulating emissions from heavy-duty engines and trucks, it has never treated the trailer as part of a truck so as to fall within the definition of “motor vehicle,” and there is no evidence Congress ever intended such a result. Likewise, NHTSA lacks statutory authority. Its governing authority for fuel economy standards, the Energy Independence and Security Act (EISA), also does not define heavy-duty “vehicle” to include a trailer. In the rulemaking, NHTSA has erroneously relied instead on definitions in the Motor Vehicle Safety Act, which separately authorizes NHTSA to adopt safety regulations but does not address fuel efficiency or emissions of any kind. *See* 49 U.S.C. § 30101.

The standards are arbitrary and capricious. The GHGP2 standards for trailers, if implemented, will do little to reduce greenhouse gas emissions or improve fuel economy. TTMA members and the trucking industry already participate extensively in EPA’s voluntary Smartway program to develop and incorporate aerodynamic equipment in trailers where there are benefits from doing so. This is particularly true for trailers hauled regularly over long distances at highway speeds, where aerodynamic efficiency makes a measurable difference. But aerodynamic devices such as side skirts and trailer tails also add significant weight to trailers and thus are counterproductive in multiple short-run operations and at lower speeds (where most of the trailers’ moving time occurs). In lower speed operations, aerodynamic efficiency is not achieved and the equipment is only counter-productive dead weight. EPA and NHTSA erroneously assumed in the rulemaking that tractor-trailers, on average, operate near highway speeds most of the time. Moreover, heavy-duty trucks are subject to an 80,000-pound maximum combined weight limit for tractor, trailer and cargo. Because the GHGP2 rule will mandate aerodynamic equipment on trailers, trucking companies who already haul loads that are at or near this limit in order to maximize efficiency will have to reduce the cargo in each load and haul the excess on additional trailers. The result will be more (and heavier) tractor-trailers on the nation’s highways to haul the same total amount of freight. In addition to the costs of the aerodynamic equipment, this will add more trucks burning more fuel with more emissions, especially in low-speed service for which the additional equipment has no material benefits. It will also result in more accidents and more injuries and fatalities involving tractor-

trailers, which is contrary to NHTSA's primary mission under the Motor Vehicle Safety Act. 81 Fed Reg. at 73,642.

3. *The Executive Order Requires Review, Reconsideration and Rescission.* Section 3(d) of President Trump's March 28, 2017 Executive Order mandates that all agencies review and identify actions that are related to or arose from President Obama's June 2013 Climate Action Plan. As noted above, the GHGP2 rule, including the trailer standards, are clearly within the scope of this Order. The Order further directs that each agency shall, as soon as practicable, publish for notice and comment proposed rules suspending, revising, or rescinding any such actions, as appropriate and consistent with law and the policies stated in Section 1 of the Order. The Order states in its very first sentence as policy to avoid regulatory burdens that unnecessarily constrain economic growth and prevent job creation. Section 1 goes on to elaborate as policy that environmental regulations must comply with the law, have greater benefits than costs, and rely on the best available peer-reviewed science and economics. For the reasons described above, the trailer requirements in the GHGP2 rule conflict with these policies.

Furthermore, we note that in seeking to justify the costs as outweighing the benefits of the GHGP2 rule, EPA relied on the Obama Administration's "social cost of carbon." See 81 Fed. Reg. at 73,875 (explaining that the agencies "estimate the global social benefits of CO₂ emission reductions expected from the heavy-duty GHG and fuel efficiency standards using the social cost of carbon"). The March 28 Executive Order directed that the prior Administration's social cost of carbon analyses be withdrawn, and that, effective immediately, agencies shall ensure that estimates used in valuing the GHG impacts of regulations be consistent with OMB Circular A-4 (Sept. 17, 2003). The Order specifically directed that this include the approach to considering domestic versus international impacts and the consideration of the appropriate discount rates. Accordingly, the Order directs a new approach, effective immediately, that is different from and in conflict with the approach EPA used to justify the GHGP2 standards, which the Order makes clear is "no longer representative of government policy." Not only does this constitute a further policy reason to revisit the trailer requirements, but it constitutes centrally relevant new information warranting reconsideration of the rule under Section 307(d)(7)(B) of the Clean Air Act, 42 U.S.C. § 7607(d)(7)(B).

4. *EPA Action is Urgent to Avoid Substantial Economic Impacts.* As anticipated in the directive of Section 3(d) of the Executive Order that the agencies take action "as soon as practicable," this matter is of great time sensitivity to TTMA's members. Although the GHGP2 standards apply to trailers manufactured after January 1, 2018, the standards will have costly impacts on trailer manufacturers in the latter half of 2017. The manufacturers will soon have to quote and commit in advance to trailer orders for production in 2018, and they will soon begin incurring substantial expenditures for parts inventory and for reconfiguring manufacturing plants and assembly lines to enable installation of the required devices. These are, in many cases, small- to medium-sized businesses throughout the country who can ill afford the unnecessary burdens of these standards, which will impact them, their employees, customers and the economy at large.

TTMA would like to meet with you or your designees to seek an immediate path to reconsideration of the GHGP2 trailer requirements and an approach to stay the effectiveness of the rule in the interim to avoid the burden and disruption of imminent steps to comply. We very much appreciate your attention to this important matter and your consideration of our requests on an expedited basis.

Sincerely,

Jeff Sims, President

Re: Truck Trailer Manufacturers Association Petition for Reconsideration and
Stay of GHG and Fuel Efficiency Standards -- Docket No. EPA-HQ-
OAR-2014-0827

Dear Administrator Pruitt and Acting Deputy Administrator Danielson:

Enclosed please find the Truck Trailer Manufacturer Association's supplemental petition for reconsideration and a stay of the EPA and NHTSA final rule titled "Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2." A copy of this petition has been electronically mailed to the Office of Air and Radiation Docket Center for filing in Docket No. EPA-HQ-OAR-2014-0827 and has been mailed to NHTSA's Docket Operations office for filing in Docket No. NHTSA-2014-0132.

Please contact me if you have any questions.

Sincerely,

Jonathan S. Martel

Enclosure

_____}

SUPPLEMENT TO PETITION FOR RECONSIDERATION AND STAY

Pursuant to Section 307(d)(7)(B) of the Clean Air Act (“CAA”)¹ and Sections 553 and 705 of the Administrative Procedure Act (“APA”),² the Truck Trailer Manufacturers Association, Inc. (“TTMA”) hereby supplements its April 3, 2017 request³ that the U.S. Environmental Protection Agency (“EPA”) and National Highway Traffic Safety Administration (“NHTSA”) (collectively, the “Agencies”) reconsider and rescind the greenhouse gas (“GHG”) and fuel economy standards applicable to heavy-duty truck trailers, as promulgated in the final rule entitled *Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2*, 81 Fed. Reg. 73,478 (Oct. 25, 2016) (“Final Rule”). TTMA further requests in the interim that EPA stay the implementation date of the new GHG standards applicable to trailers, currently set for January 1, 2018.

This is the first time that EPA and NHTSA have sought to impose emissions and fuel economy standards on trailers, which by design are pulled by another vehicle and therefore emit no GHGs and consume no fuel. The Agencies should rescind these standards for the simple reason that they lack legal authority to adopt such standards. The Clean Air Act authorizes EPA to regulate “motor vehicles,” expressly defined as vehicles that are “self-propelled.” A trailer is not self-propelled. The rationale EPA offered in the Final Rule—that trailers may be regulated as “incomplete vehicles”—reads the definition of “motor vehicle” out of the statute. A “motor vehicle” that is “incomplete” because it is not “self-propelled” and requires a tractor to pull it is not a motor vehicle. Likewise, the Energy Independence and Security Act extends NHTSA’s fuel economy regulatory authority to “commercial medium- and heavy-duty on-highway vehicle[s],” defined to mean “an on-highway vehicle with a GVWR of 10,000 lbs or more.” GVWR, or gross *vehicle* weight rating, is the maximum load that can be carried by a vehicle,

¹ 42 U.S.C. § 7407.

² 5 U.S.C. §§ 553(e), 705.

³ On April 3, 2017, TTMA sent a letter to EPA Administrator Scott Pruitt and Department of Transportation (“DOT”) Secretary Elaine Chao requesting that the Agencies reconsider and rescind the GHG standards applicable to trailers. TTMA resubmitted the April 3 letter to EPA on April 13, 2017 in response to EPA’s Request for Comment on regulations that may be appropriate for repeal, replacement, or modification under Executive Order 13777, “Enforcing the Regulatory Reform Agenda.” See 82 Fed. Reg. 17,793 (Apr. 13, 2017). On June 1, 2017, TTMA sent a similar request to Jeffrey Rosen, DOT Regulatory Reform Officer, following his appointment to the position of Chairman of the DOT Regulatory Reform Task Force.

including the weight of the vehicle. Heavy-duty vehicles also have a gross *combined* weight rating (GCWR), which describes the maximum load that the vehicle can haul, including the weight of a loaded trailer. The vehicles subject to NHTSA's fuel economy authority, defined by reference to GVWR, therefore exclude trailers, and TTMA fully anticipates that the D.C. Circuit would reject a theory that allows administrative agencies unilaterally to expand their regulatory reach to products that Congress expressly excluded from regulation. Beyond that, the trailer standards are arbitrary and capricious. The Agencies employed unrealistic assumptions about the speeds that trailers hauled by heavy-duty tractors travel. In addition, the Agencies failed properly to account for the additional weight of aerodynamic devices that in many circumstances would *increase* fuel consumption and also displace cargo, which would result in more trips and more emissions. Those additional trips also translate into more injuries and fatalities on U.S. roads in order to achieve negligible if any global climate benefits.

In short, the Agencies have offered a rationale that is unsupported by the statutory language and that vastly expands their regulatory reach to products that are not encompassed in the enabling statutes and that have never been subject to air pollution, GHG or fuel economy regulation before. The regulations that the Agencies have imposed will have irreparable and immediate harmful effects on the trailer manufacturing members of TTMA. Reconsideration and a stay are therefore warranted.

BACKGROUND

In October 2016, the Agencies promulgated a Final Rule establishing "Phase 2" GHG and fuel economy standards for on-road medium- and heavy-duty vehicles and engines. *See* 81 Fed. Reg. 73,478 (Oct. 25, 2016). The Final Rule includes standards applicable to a range of heavy-duty vehicles and engines, including combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. *Id.* at 73,478. As relevant here, however, the Final Rule also includes, for the first time, GHG and fuel economy standards that apply directly to *trailers* that are hauled by heavy-duty tractors. *Id.* at 73,642 ("The HD Phase 2 program represents the first time CO₂ emission and fuel consumption standards have been established for manufacturers of new trailers."). Prior to the Final Rule, neither EPA nor NHTSA regulated the GHG and fuel economy impacts of trailers, instead relying on voluntary programs (such as EPA's SmartWay Program) and market incentives to encourage manufacturers to adopt aerodynamic and other technologies that, under limited operating conditions, can reduce GHG emissions and improve fuel economy from tractors when hauling trailers equipped with these technologies.

A. The Trailer Standards and EPA Compliance Program

The new GHG and fuel economy standards mandate that certain types of trailers manufactured after January 1, 2018 (in the case of the EPA GHG standards)⁴ or January 1, 2021

⁴ *See* 81 Fed. Reg. at 74,049; 40 C.F.R. § 1037.5(h)(4). Qualifying "small manufacturers," defined to include manufacturers with fewer than 1,000 employees, are not subject to the GHG manufacturing standards until January 1, 2019, although they still must register with EPA and label as "exempt" all trailers manufactured in 2018. 81 Fed. Reg. at 74,059; 40 C.F.R. § 1037.150(c).

(in the case of the NHTSA fuel economy standards)⁵ comply with specified emission limits. These emission limits are expressed in grams of carbon dioxide (“CO₂”) per ton-mile⁶ and gallons per 1,000 ton-miles for the GHG and fuel economy standards, respectively.⁷ Of course, trailers do not themselves emit CO₂ or consume fuel for propulsion. Thus, the Final Rule requires manufacturers to calculate estimated CO₂ emissions levels and fuel consumption rates using a “compliance equation” that is specified in the regulations.⁸ According to the Agencies, this compliance equation was developed using “standard” reference tractors and thus “the regulatory standards refer to the simulated emissions and fuel consumption of a standard tractor pulling the trailer being certified.”⁹ To meet the new emission standards, trailer manufacturers must install aerodynamic devices (such as side skirts and trailer tails), low-rolling resistance tires and automatic tire inflation systems. Depending on specific trailer designs, and as the standards tighten over time under the regulations, trailer manufacturers may also be forced to utilize lightweight materials. All of these options are assigned inputs to the compliance equation.¹⁰

Trailer manufacturers must perform several steps in advance of 2018 to ensure that their trailers manufactured after January 1, 2018 comply with the new EPA GHG standards. In particular, trailer manufacturers must register on-line with the EPA Verify access system, obtain a manufacturer code, and develop and submit applications for certificates of conformity,¹¹ although the EPA has not yet developed or implemented the procedures that allow manufacturers to make these applications and does not expect to do so until roughly the end of the summer. These steps require manufacturers to assess their trailer model lines and make plans for incorporating the mandated equipment (side skirts, trailer tails, low-rolling resistance tires, automatic tire inflation and tire pressure monitoring systems, etc.) into projected customer orders. Manufacturers also must evaluate, and in some cases test, the equipment to be installed to determine the applicable inputs for the compliance equation used to calculate GHG emissions and fuel consumption for various trailer types and configurations.¹² They must project sales for 2018 and obtain a certificate of conformity from EPA before selling any Model 2018 trailers, and then they must negotiate or re-negotiate sales orders and complete custom engineering for those trailers to incorporate the necessary equipment even if their customers would not otherwise purchase it. The manufacturers must acquire GHG inventory, train employees, and re-configure

⁵ See 81 Fed. Reg. at 74,238; 49 C.F.R. 535.3(d)(5)(iv) (NHTSA standards go into effect January 1, 2021 and are voluntary for model years 2018 through 2020).

⁶ See 81 Fed. Reg. at 74,054; 40 C.F.R. § 1037.107.

⁷ See 81 Fed. Reg. at 74,255; 49 C.F.R. § 535.5(e).

⁸ See 81 Fed. Reg. at 74,073, 74259; 40 C.F.R. § 1037.515(a)(1); 49 C.F.R. § 535.6(e).

⁹ 81 Fed. Reg. at 73,647.

¹⁰ Under the EPA rules, for model years through 2026, trailer manufacturers may designate a limited number of trailers as exempt from the standards and certification requirements. See 81 Fed. Reg. at 74,060; 40 C.F.R. § 1037.150(v). As a practical matter, however, nearly all trailers will be required to meet the new GHG standards starting in 2018 (or 2019 for “small” manufacturers).

¹¹ See 81 Fed. Reg. at 74,062; 40 C.F.R. § 1037.205.

¹² See, e.g., 81 Fed. Reg. at 74,081; 40 C.F.R. § 1037.526.

assembly lines to enable production, and they must develop data collection and reporting systems to ensure compliance. Trailer manufacturers would not have to incur these costs and disruptions in customer relations and manufacturing processes but for the GHG standards for trailers.

B. TTMA Petition for Review and Correspondence with the Agencies

On December 22, 2016, TTMA filed a petition for review of the Final Rule in the U.S. Court of Appeals for the D.C. Circuit on the grounds that (1) the Agencies lack statutory authority to regulate trailers with respect to GHG emissions and fuel consumption, and (2) the Final Rule, as applied to trailers, is arbitrary and capricious because, among other reasons, the Agencies utilized unrealistic assumptions in their cost/benefit analysis and failed properly to account for the additional weight and cost of aerodynamic devices, which increase fuel consumption and displace cargo, thereby resulting in more trips, more emissions, and more accidents. *See Truck Trailer Manufacturers Association v. EPA, et al.*, No. 16-1430. That litigation is pending and, as of the date of this Petition, no briefing schedule has been set.

On April 3, 2017, TTMA sent a letter to EPA Administrator Scott Pruitt and Department of Transportation (“DOT”) Secretary Elaine Chao requesting that the Agencies reconsider and rescind the Phase 2 GHG and fuel economy standards applicable to trailers. TTMA resubmitted the April 3 letter to EPA on April 13, 2017 in response to EPA’s Request for Comment on regulations that may be appropriate for repeal, replacement, or modification under Executive Order 13777, “Enforcing the Regulatory Reform Agenda.” *See* 82 Fed. Reg. 17,793 (Apr. 13, 2017). In light of TTMA’s request, the Agencies moved for a 90-day abeyance of the D.C. Circuit litigation, which the Court granted on May 8, 2017.

ISSUES MERITING RECONSIDERATION

EPA and NHTSA should reconsider the Final Rule; in fact, they are required to do so. On March 28, 2017, President Trump issued Executive Order 13777 on Promoting Energy Independence and Economic Growth. Section 3(d) of the Executive Order mandates that all agencies review and identify actions that are related to or arose from President Obama’s June 2013 Climate Action Plan. The GHG and fuel economy trailer standards contained in the Final Rule are clearly within the scope of this Order, because the Final Rule is related to and arose from the 2013 Climate Action Plan. *See* Executive Office of the President, *The President’s Climate Action Plan* at 8 (June 2013) (addressing increased fuel economy standards for heavy-duty vehicles); *see also* 81 Fed. Reg. at 73,480 (describing the Final Rule as having been “called for” in the 2013 Climate Action Plan). The Executive Order further directs that each agency shall, as soon as practicable, publish for notice and comment proposed rules suspending, revising, or rescinding any such actions, as appropriate and consistent with law and the policies stated in Section 1 of the Order. The Order states in its very first sentence a policy to avoid regulatory burdens that unnecessarily constrain economic growth and prevent job creation. Section 1 goes on to elaborate as policy that environmental regulations must comply with the law, have greater benefits than costs, and rely on the best available peer-reviewed science and economics. For the reasons summarized above and detailed below, the trailer requirements in the Final Rule are unlawful and conflict with these policies.

Furthermore, in seeking to justify the costs as outweighing the benefits of the Final Rule, the Agencies relied on the Obama Administration's "social cost of carbon." *See* 81 Fed. Reg. at 73875 (explaining that the Agencies "estimate the global social benefits of CO₂ emission reductions expected from the heavy-duty GHG and fuel efficiency standards using the social cost of carbon"). The March 28 Executive Order directed that the prior Administration's social cost of carbon analyses be withdrawn, and that, effective immediately, agencies shall ensure that estimates used in valuing the GHG impacts of regulations be consistent with OMB Circular A-4 (Sept. 17, 2003). The Order specifically directed that this include considering the societal benefits of reducing carbon in the United States but not the rest of the world, and a different approach to considering the appropriate discount rates. Accordingly, the Order directs a new approach, effective immediately, that is different from and in conflict with the approach the Agencies used to justify the Final Rule, including the trailer standards. The Order makes clear that the Agencies' approach is "no longer representative of government policy." Not only does this constitute a further policy reason to revisit the trailer requirements, but it constitutes centrally relevant new information requiring reconsideration of the rule under Section 307(d)(7)(B) of the Clean Air Act, 42 U.S.C. § 7607(d)(7)(B). Indeed, such reconsideration is especially acute here, where the Agencies judged the requirements as worthwhile after weighing benefits of reducing carbon—including such benefits outside of the United States—against costs that include an increase in traffic accidents and several additional highway fatalities in the United States.

REQUEST FOR CAA 307(D) STAY PENDING RECONSIDERATION

Section 307(d)(7)(B) of the CAA authorizes EPA to stay the effectiveness of a rule that it is reconsidering "for a period not to exceed three months." 42 U.S.C. § 7607(d)(7)(B). Such a stay gives the Agency time to reconsider its position and review the rule's requirements without imposing unnecessary compliance costs on regulated entities. EPA also may use a section 307(d) stay to avoid any confusion caused by the Agency implementing and then subsequently revising its regulatory requirements. Staying—or, in this case, extending—the implementation date of the new GHG standards for trailers until EPA completes its reconsideration process thus avoids the otherwise imminent compliance burdens and uncertainty for the regulated industry.

TTMA respectfully requests that EPA exercise its authority under the CAA to stay the effectiveness of the GHG standards for trailers pending reconsideration to the fullest extent permissible by the Clean Air Act. The Final Rule imposes imminent and substantial compliance obligations on trailer manufacturers that have more than 1,000 employees. The new GHG standards for trailers require compliance by TTMA's members beginning January 1, 2018. *See* 81 Fed. Reg. at 74049; 40 C.F.R. § 1037.5(h)(4). For 2018 trailer production, these new GHG standards will mandate installation of side skirts, trailer tails, low rolling resistance tires, and tire pressure inflation/monitoring systems on nearly all trailers manufactured and sold in the United States by TTMA's members.¹³ As explained in more detail below, trailer manufacturers must

¹³ As noted, qualifying small manufacturers are exempt from the GHG manufacturing standards until January 1, 2019, although they must still register with EPA and label their 2018 Model trailers as exempt. *See* 81 Fed. Reg. at 74,059; 40 C.F.R. § 1037.150(c). Other manufacturers

Footnote continued on next page

take steps well before January 1, 2018 to comply with these new EPA requirements. Staying the rule during reconsideration—by extending the January 1, 2018 implementation date for the EPA trailer standards—will avoid imposing these compliance costs prematurely and avoid confusion and disruption among the regulated industry. In short, a stay would afford EPA the time necessary fully to reconsider the Final Rule without adversely affecting the regulated industry.

REQUEST FOR APA 705 STAY PENDING JUDICIAL REVIEW

In addition to this petition for reconsideration, TTMA has filed a petition for review in the U.S. Court of Appeals for the D.C. Circuit challenging the Final Rule on the grounds that the new GHG and fuel economy standards applicable to trailers exceed the scope of EPA and NHTSA's statutory authorities and the Agencies did not adequately consider costs or properly assess benefits when promulgating these new standards. While judicial review is pending, Section 705 of the APA allows EPA to stay the effective date of a final rule if it "finds that justice so requires." 5 U.S.C. § 705. TTMA requests that EPA make such a finding here.

Both EPA and the courts have applied a four-part test to determine whether "justice so requires" a stay of agency action pending judicial review. Under that test, the Agency must consider: (1) whether there is a likelihood of success on the merits of the judicial challenge, (2) irreparable harm to the moving party if the stay is not granted, (3) the potential for harm to others if the stay is granted, and (4) whether the public interest weighs in favor of granting the stay. *Sierra Club v. Jackson*, 833 F. Supp. 2d 11, 30 (D.D.C. 2012). As explained below, each of these factors weighs in favor of staying this Final Rule as applied to trailers until the resolution of judicial review.

A. TTMA's Challenge is Likely to Succeed on the Merits

The TTMA's petition for review is likely to succeed on the merits. Principally, the Clean Air Act makes manifestly clear that EPA lacks authority to regulate trailers. Even if EPA had such authority, the rule would be invalid because it is arbitrary and capricious.

1. EPA Lacks Authority To Regulate Trailers

EPA claims that it has authority to regulate trailers under Section 202 of the Clean Air Act, which authorizes EPA to prescribe "standards applicable to the emission of any air pollutant from any class or classes of new motor vehicles or new motor vehicle engines ..., whether such vehicles and engines are designed as complete systems or incorporate devices to prevent or control such pollution." 42 U.S.C. § 7521(a)(1). But the Act defines the term "motor vehicle" to mean "any self-propelled vehicle designed for transporting persons or property on a street or highway." *Id.* § 7550(2). It is undisputed that a trailer is not self-propelled. That should be the end of the matter. If a trailer is not self-propelled, it is not a motor vehicle under § 7550(2), and the EPA may not regulate it under § 7521(a)(1).

Footnote continued from previous page

can exempt up to 20 percent of their annual production, subject to caps of 350 units for box van trailers and 250 units for non-box trailers. See 81 Fed. Reg. at 74,060; 40 C.F.R. § 1037.150(v).

In the Final Rule, EPA argues that a trailer is something called an “incomplete vehicle,” a term that appears nowhere in the Clean Air Act. EPA argues that it can regulate “incomplete vehicles” because the Act applies “whether [motor vehicles] and [motor vehicle] engines are designed as complete systems or incorporate devices to prevent or control such pollution.” § 7521(a)(1). This statutory language does just what it says: it provides authority to regulate motor vehicles or engines that are not complete *systems*, in the sense that they incorporate pollution-controlling devices. But a vehicle that is not “designed as [a] complete system[]” because it contains a pollution-controlling device is nonetheless self-propelled, and it is still a motor vehicle. The Act’s grant of regulatory power over motor vehicles that incorporate pollution-controlling devices does not somehow implicitly signal that EPA also can regulate products that are *not* motor vehicles. Indeed, if EPA’s analysis were correct, the phrase “motor vehicle engine” in § 7521(a)(1) would be entirely superfluous. After all, under EPA’s theory, an engine is as much an “incomplete vehicle” as a trailer. If Congress had intended to authorize the regulation of “incomplete vehicles” in a manner that would encompass trailers, the statute would have said so.

The Final Rule describes three other statutory provisions as “incomplete vehicle provisions,” 81 Fed. Reg. 73,514, but the provisions each expressly require that “motor vehicles” meet specified requirements, rather than imposing requirements on components. *See* § 7521(a)(6) (EPA must require that “new light-duty vehicles ... be equipped with” onboard vapor recovery systems); § 7521(a)(5)(A) (“fill pipe standards for new motor vehicles”); § 7521(k) (regulations “applicable to evaporative emissions of hydrocarbons from all gasoline-fueled motor vehicles”). EPA’s statement that these provisions concern “incomplete vehicles” is puzzling at best. Of course regulating a “motor vehicle” may *impact* or even necessitate additional components or parts of that vehicle, but no normal speaker of English would conclude that, for example, a provision requiring a vehicle to contain an onboard vapor recovery system constitutes a regulation of an “incomplete vehicle.” But it is academic in any event. If EPA is correct that the Act contains specific provisions targeted at specific types of equipment that are not “motor vehicles” but rather “incomplete vehicles,” that only confirms that the grant of authority in § 7521(a) does not extend generally to *anything* the EPA might term an “incomplete vehicle.”

Even if EPA could regulate an “incomplete vehicle” under the convoluted theory that § 7521(a) refers to “systems” that are not “complete,” a trailer would not qualify. A trailer may sometimes be attached to a tractor, but that no more makes it an “incomplete vehicle” than a wagon is an “incomplete horse.” The term “incomplete” means “lacking a usually necessary part, element, or step.”¹⁴ A trailer is not a “necessary part” of a vehicle, and obviously is not “necessary” for purposes of self-propulsion, which is the defining feature of the term “motor vehicle” in the Clean Air Act. Trailers are manufactured and sold separately to different ultimate purchasers from tractors, and the same trailers are routinely attached to and hauled by many different tractors over the course of their useful life. Each tractor likewise hauls many different trailers. A particular tractor-trailer combination is thus in no sense a single motor vehicle. In fact, the EPA itself in previous rulemakings has made clear its interpretation that that trailers are

¹⁴ <https://www.merriam-webster.com/dictionary/incomplete>

not vehicles, incomplete or otherwise; instead, the tractor is the vehicle, and the trailer is not. *E.g.*, 76 Fed. Reg. 57,106, 57,114 (Sept. 15, 2011) (explaining that “gross combined weight rating ... describes the maximum load that the vehicle can haul, including the weight of a loaded trailer *and the vehicle itself*”) (emphasis added).

Indeed, the United States government has repeatedly and successfully taken the common-sense position that a trailer is not a vehicle for purposes of federal criminal laws precisely because it is not “self-propelled,” *see* 18 U.S.C. § 2311, and that this *does not change* when the trailer is attached to the truck. This theory that a trailer attached to a tractor is not a vehicle has enabled the government to charge individuals who steal a combination tractor-trailer with two crimes—stealing a vehicle (the tractor) and stealing a “good” (the trailer)—and obtain consecutive sentences. *E.g.*, *Bernard v. United States*, 872 F.2d 376, 377 (11th Cir. 1989); *United States v. Lofty*, 455 F.2d 506, 506 (4th Cir. 1972); *United States v. Kidding*, 560 F.2d 1303, 1308 (7th Cir. 1977). As the Seventh Circuit explained in adopting the United States’ argument in that context, “[c]learly a trailer, if it stands alone, is not a motor vehicle,” and the combination of the trailer and tractor does not change that result, because the “trailer was not indispensable to making the tractor a ‘vehicle.’” *Id.*

EPA’s theory that Congress silently authorized the regulation of trailers via § 7521(a)(1)’s “complete systems” language is also irreconcilable with the language of numerous other federal statutes that define the term “motor vehicle” to reach trailers expressly. *E.g.*, 40 U.S.C. § 17101(2) (“‘motor vehicle’ means a vehicle, self-propelled or drawn by mechanical power...”); 40 U.S.C. § 17501(2) (“‘motor vehicle means ... a vehicle self-propelled or drawn by mechanical power”); 18 U.S.C. § 31(a)(6) (“‘motor vehicle’ means every description of carriage or other contrivance propelled or drawn by mechanical power”); 49 U.S.C. § 30102(7) (“‘motor vehicle’ means a vehicle driven or drawn by mechanical power ...”); 49 U.S.C. 32101(7) (same); 49 U.S.C. § 30301 (“‘motor vehicle’ means a vehicle, machine, tractor, trailer, or semitrailer propelled or drawn by mechanical power”). Congress “knew how to provide for” regulation of trailers, *Meghrig v. KFC Western, Inc.*, 516 U.S. 479, 485 (1996), and its omission of language like “drawn by mechanical power” in the Clean Air Act confirms that it did not intend to do so here.

Finally, the “incomplete vehicle” theory would render EPA’s regulatory authority essentially limitless. EPA protests that interpreting § 7521(a)(1) to cover “incomplete vehicles” “is not to say that the Act authorizes emission standards for any part of a motor vehicle, however insignificant.” 81 Fed. Reg. 73514. But under EPA’s interpretation in the Final Rule, the Act *does* authorize the EPA to set emissions standards for any part of a motor vehicle. Nothing in the Act provides any basis upon which to distinguish between a trailer and any other component; there is no “intelligible principle” contained within the Act itself. *Mistretta v. United States*, 488 U.S. 361, 372 (1989). The Final Rule announces that a trailer “properly fall[s] on the vehicle side of the line,” 81 Fed. Reg. 73515, but this is just ipse dixit. The absence of any “intelligible principle” in the Act that sets the limits of EPA’s authority to decide what constitutes an “incomplete vehicle” is a strong indication that the Act does not in fact permit regulation of an

“incomplete vehicle.” Indeed, if EPA’s interpretation were correct, the Act would be unconstitutional under the nondelegation doctrine. *Mistretta*, 488 U.S. at 372.¹⁵

At bottom, EPA’s “incomplete vehicle” theory would vastly expand its regulatory reach to equipment that Congress expressly excluded from regulation, namely, equipment that is not self-propelled. Dubbing something an “incomplete vehicle” is just another way of saying that it is *not* a vehicle. EPA’s argument is highly unlikely to succeed on the merits.

2. The Rules are Arbitrary and Capricious

Even if EPA did have authority under the Clean Air Act to regulate trailers—and it does not—the trailer standards are arbitrary and capricious.

First, the Agencies overstated the GHG and fuel economy benefits of the trailer standards by using unrealistic and unsupported assumptions regarding the speeds at which trailers hauled by heavy-duty tractors travel. The Agencies projected GHG and fuel economy benefits from, among other things, drag reduction achieved by aerodynamic devices, which is primarily a function of vehicle speed.¹⁶ In performing their analysis, the Agencies used drive cycle weightings from the Phase 1 heavy-duty vehicle rule to characterize the percentage of vehicle miles traveled at certain speeds—below 55 miles per hour (“mph”), between 55 and 65 mph, and above 65 mph—by different types of trailers.¹⁷ Those drive cycle weightings, however, are not supported by the underlying data. In fact, although the Agencies characterized the percentage of vehicle miles traveled at speeds exceeding 65 mph, not one of the studies upon which the Agencies relied actually included a “greater than 65 mph” speed category.

¹⁵ TTMA has also petitioned for review of the fuel economy standards in the Final Rule, on the ground that NHTSA too lacked authority to regulate trailers. The Energy Independence and Security Act, which authorized NHTSA’s participation in the rulemaking, applies to “commercial medium- and heavy-duty on-highway vehicle[s],” 49 U.S.C. § 32902(k)(2), and defines that term to mean “an on-highway vehicle with a GVWR of 10,000 lbs or more,” *id.* § 32901(a)(7). That definition excludes a trailer. As EPA has recognized in prior rulemakings: “GVWR describes the maximum load that can be carried by a vehicle, including the weight of the vehicle itself. Heavy-duty vehicles also have a gross combined weight rating (GCWR), which describes the maximum load that the vehicle can haul, including the weight of a loaded trailer and the vehicle itself.” 76 Fed. Reg. 57,106, 57,114 (Sept. 15, 2011). Congress’s reference to GVWR thus excludes trailers as a textual matter. However, because TTMA is only seeking a stay of the emissions standards promulgated by the EPA because NHTSA’s mandatory standards do not take effect until January 1, 2021, there is no need to consider the TTMA’s likelihood of success on its challenge to NHTSA’s authority at this time.

¹⁶ Speed matters exponentially, as the basic drag equation uses velocity *squared*. Adding another 5 miles per hour to 50 mph input data produces a result much greater than a 10% increase. Reductions in drag calculated for aerodynamic equipment on trailers that are assumed to operate at higher than actual speeds will similarly overstate benefits.

¹⁷ EPA/NHTSA, Response to Comments for Joint Rulemaking, EPA-420-R-16-901, at 1030-31 (Aug. 2016).

The Agencies assumed that long (53-foot) dry-freight and refrigerated vans are operated at speeds exceeding 65 mph for 86 percent of the vehicle miles traveled and at speeds between 55 and 65 mph for 9 percent of the vehicle miles traveled.¹⁸ The Agencies further assumed that short dry-freight and refrigerated vans are operated at speeds exceeding 65 mph for 64 percent of the vehicle miles traveled and at speeds between 55 and 65 mph for 17 percent of the vehicle miles traveled.¹⁹ The Agencies explained that these ranges were derived from three studies: (1) an EPA MOVES analysis of Federal Highway Administration data from 1999; (2) a University of California Riverside (UCR) evaluation in 2006 of data from 270 trucks; and (3) an Oak Ridge National Laboratory study of a fleet of six trucks published in 2009.²⁰ Critically, however, not one of these studies included a “greater than 65 mph” speed category—the EPA MOVES and Oak Ridge analyses reported the fraction of vehicle miles traveled at speeds exceeding 60 mph, and the UCR analysis reported the fraction of vehicle miles traveled at speeds exceeding 45 mph.²¹ Moreover, the actual percentages used by the Agencies (86 and 9 percent for long van trailers and 64 and 17 percent for short van trailers) come directly from the EPA MOVES analysis. But the speed ranges reported in the EPA MOVES analysis were actually five mph slower—greater than 60 mph and 50 to 60 mph, respectively.²² In other words, the Agencies assumed that long van trailers travel at speeds exceeding 55 mph for 95 percent of the vehicle miles traveled based solely on data reporting that such trailers travel at speeds exceeding 50 mph for 95 percent of the vehicle miles traveled. Simply put, the Agencies selected the highest percentages for miles traveled from only one of the three cited data sources, in effect ignoring the other two, and then inflated the speed threshold for those miles traveled. As a consequence, the Agencies’ own data do not support the speed distribution ranges they used to evaluate the purported benefits of the trailer standards, thus rendering those standards themselves arbitrary and capricious.²³

¹⁸ See 81 Fed. Reg. at 73,654.

¹⁹ *Id.*

²⁰ EPA/NHTSA, Response to Comments for Joint Rulemaking, EPA-420-R-16-901, at 1030 (Aug. 2016).

²¹ *Id.* at 1031 (Table 3-14).

²² *Id.*

²³ Moreover, even if the Agencies accurately characterized the data from the EPA MOVES analysis, those data are not representative of real-world operation. The EPA MOVES data for long van trailers, for example, were recorded on “restricted access” highways. EPA/NHTSA, Response to Comments for Joint Rulemaking, EPA-420-R-16-901, at 1030 (Aug. 2016). Long van trailers are operated on all types of highways, not just those with restricted access. In fact, most non-restricted rural highways do not even allow speeds in excess of 65 mph. Utility Trailer Manufacturing Company (“Utility”) submitted data from three long-haul trucking fleets that more accurately reflect real-world operation. Comments of Utility Trailer Manufacturing Co., EPA-HQ-OAR-2014-0827-1183, at 4-7. The Agencies erroneously concluded that “the fleet data provided by Utility is not substantially different than the current GEM drive cycle weightings.” Memorandum to Docket EPA-HQ-OAR-2014-0827, “Comparison of GEM Drive Cycle Weightings and Fleet Data Provided by Utility Trailer Manufacturing Co. in Public Comments” (July 2016). The record does not support that conclusion. Whereas the Agencies

Footnote continued on next page

Second, the Agencies failed to account fully for the additional weight of aerodynamic devices, which increase fuel consumption and displace cargo, resulting in more trips, more emissions, and more accidents. As described above, the GHG trailer standards will mandate that trailer manufacturers install side skirts and trailer tails, among other devices, on nearly all of the trailers they manufacture. Side skirts add, on average, about 250 pounds to the weight of a typical 53-foot trailer, and trailer tails add an additional 150 pounds.²⁴ The Agencies attempted to evaluate the impact of additional vehicle weight due to the use of aerodynamic devices,²⁵ but failed to address the effect of cargo displacement. Because motor carriers must operate below an 80,000-pound maximum weight limit for the tractor, trailer and cargo combined,²⁶ the addition of side skirts and tails would cause some trucks to “weigh-out.” Consequently, motor carriers will have to shift cargo from some of their trucks, resulting in additional trips to transport freight that could not be moved by the “weighed-out” trucks. TTMA estimates that these additional trips would cause an additional 184 million truck miles traveled per year, resulting in additional emissions as well as 246 more accidents and 7 additional fatal crashes per year.²⁷

In response to these concerns, the Agencies summarily explained that the additional weight from aerodynamic devices “can easily be offset by substituting lightweight components” elsewhere in the trailer designs.²⁸ This response is not sufficient. Motor carriers already demand that trailers weigh and cost as little as possible while still being capable of carrying the expected freight loads. Lighter-weight alternative materials (such as aluminum) are considerably more expensive than standard materials (such as steel), and often are not desired by customers. The Agencies’ unreasonably assume that trailer manufacturers required to add several hundred pounds of aerodynamic equipment to their trailers will voluntarily offset that weight by installing more expensive, light-weight technologies. If the cost of the light-weight material is not worthwhile to customers in the first instance to make room for more cargo, there is no reason to believe that they will be willing to bear that additional cost to make room for more cargo just

Footnote continued from previous page

determined that long van trailers travel at speeds exceeding 55 mph for 95 percent of the vehicle miles traveled, Utility’s data show that such trailers travel at speeds exceeding 55 mph for only 84 percent of the vehicle miles traveled—a difference of 11 percentage points. *Id.* at 2. The Agencies’ decision to disregard the real-world fleet data submitted by Utility was arbitrary and capricious.

²⁴ See Comments of Truck Trailer Manufacturers Association, EPA-HQ-OAR-2014-0827-1172-A1, at 7-8.

²⁵ See Memorandum to Docket EPA-HQ-OAR-2014-0827, “Impact of Additional Weight Due to Trailer Aerodynamic Devices” (July 18, 2016).

²⁶ See 23 CFR § 658.17(b).

²⁷ See Comments of Truck Trailer Manufacturers Association, EPA-HQ-OAR-2014-0827-1172-A1, at 7-8. The Agencies disagree with certain of TTMA’s assumptions and conclude that the additional truck miles will result in an increase of about three fatalities per year. EPA/NHTSA, Response to Comments for Joint Rulemaking, EPA-420-R-16-901, at 1019 (Aug. 2016).

²⁸ EPA/NHTSA, Response to Comments for Joint Rulemaking, EPA-420-R-16-901, at 1016 (Aug. 2016).

because the total cargo capacity is reduced by the aerodynamic equipment. In fact, the aerodynamic equipment consumes weight and cargo capacity, which will inexorably lead to more (and heavier) trucks in the U.S. fleet to carry the same total cargo, with the additional trucks emitting additional pollutants, adding to total truck miles traveled, and causing more accidents, injuries and fatalities.

B. TTMA's Members Will Suffer Irreparable Harm

TTMA's members face a substantial loss of business, market share, and goodwill as a consequence of the regulations, as well as irreparable compliance costs. Although the GHG regulations take effect on January 1, 2018, TTMA's members face these harms imminently. Trailers are manufactured to each customer's unique specifications, and new orders must be placed about six months in advance of actual production. Accordingly, TTMA members' customers are putting in orders for delivery in January 2018 beginning now, in June 2017.

To be in a position to produce trailers that are compliant with the GHG regulations by January 2018, TTMA's members must make far-reaching and costly changes to their business, starting now. They must identify component suppliers for the required equipment, evaluate and, where necessary, test that equipment, revise pricing and trailer option books and train sales representatives to explain the compliant option combinations to customers, add manufacturing floor space and reconfigure assembly lines, train production employees to install the new GHG equipment, and develop data collection and reporting systems to ensure compliance. One TTMA member, for example, estimates that it will incur over \$7.5 million in costs in 2017-2018 simply to provide inventory storage areas, transport the GHG equipment to its plants, modify plant facilities to enable installation of this equipment on trailers as part of its assembly lines, and secure trained employees to install the new GHG equipment on the requisite number of trailers. That figure omits costs for engineering work to evaluate all possible trailer configurations for compatibility with the new GHG regulations, the cost of administrative work needed to apply for certification and operate a compliance program, and the cost of the GHG equipment itself, and the business disruption and significant loss of efficiency while changes are made to production lines, supply chains, manufacturing protocols, and storage options. Other manufacturers, depending on their size, anticipate spending between \$300,000 and \$6.3 million in 2017-2018 on developing compliance systems and procuring and installing GHG equipment. In addition, TTMA estimates that the material and delivery costs of purchasing the new GHG equipment will exceed \$100 million annually. Even EPA assumes that its new regulations will create substantial compliance costs, including redesign, re-engineering, and identifying new suppliers.

These compliance costs qualify as irreparable harm. “[C]omplying with a regulation later held invalid almost always produces the irreparable harm of nonrecoverable compliance costs.” *Texas v. United States Envtl. Prot. Agency*, 829 F.3d 405, 433 (5th Cir. 2016) (quoting *Thunder Basin Coal Co. v. Reich*, 510 U.S. 200, 220–21, 114 S.Ct. 771, 127 L.Ed.2d 29 (1994) (Scalia, J., concurring in part and in the judgment)). For example, being forced to undertake “difficult, time-consuming, and expensive safety testing regarding the safety ... of their products” and to spend “more time and significantly more money” in development is irreparable harm that “can never be recouped.” *Bracco Diagnostics, Inc. v. Shalala*, 963 F. Supp. 20, 28-29 (D.D.C. 1997). No matter what, TTMA's members will “be forced to incur large costs which, if [they] manage[]

to survive those, will disrupt and change the whole nature of [their] business in ways that most likely cannot be compensated with damages alone.” *Am. Trucking Associations, Inc. v. City of Los Angeles*, 559 F.3d 1046, 1058 (9th Cir. 2009) (finding irreparable harm where companies would be forced to begin complying with a regulation they alleged was preempted); *see also Portland Cement Ass’n v. E.P.A.*, 665 F.3d 177, 189 (D.C. Cir. 2011) (staying portion of EPA rule because “industry should not have to build expensive new containment structures until the standard is finally determined”). TTMA’s members have no mechanism to recover these costs from the government if the GHG regulations are later held to be invalid.

Beyond compliance costs, TTMA’s members also face an irreparable loss of business relationships, market share, and goodwill. As noted, motor carriers who wish to purchase trailers equipped with side-skirts and other fuel-saving devices are already doing so; other carriers have concluded that purchasing these trailers makes no economic sense for their trucking operations. Because TTMA’s members must begin accepting orders six months ahead of delivery, most of TTMA’s members are now required to quote only compliant products to prospective customers, most of whom have so far not wanted this added equipment. Those customers will look to other trailer manufacturers who can offer exempt trailers. Preventing companies from delivering their products to customers “almost inevitably creates irreparable damage to ... good will.” *Reuters Ltd. v. UPI, Inc.*, 903 F.2d 904, 908 (2d Cir. 1990); *id.* at 909 (“irreparable harm has often consisted of the loss of customers and the competitive disadvantage that resulted from a distributor’s inability to supply its customers with the terminated product”); *Register.com, Inc. v. Verio, Inc.*, 356 F.3d 393, 404 (2d Cir. 2004) (“irreparable harm through loss of reputation, good will, and business opportunities”). The harm is especially irreparable here because not all trailer manufacturers are subject to the new regulations. Smaller manufacturers need not begin selling and installing GHG-control equipment until 2019, which means they are currently free to accept orders without the unwanted and expensive equipment. In other words, some of TTMA’s members face an imminent risk of loss of market share because, as a consequence of the new rules, their customers will *only* be able to purchase the products they prefer from other manufacturers. “It is well-established that a movant’s loss of current or future market share may constitute irreparable harm.” *Grand River Enter. Six Nations, Ltd. v. Pryor*, 481 F.3d 60, 67 (2d Cir. 2007); *Freedom Holdings, Inc. v. Spitzer*, 408 F.3d 112, 114 (2d Cir. 2005). “In a competitive industry where consumers are brand-loyal, we believe that loss of market share is a ‘potential harm which cannot be redressed by a legal or an equitable remedy following a trial.’” *Novartis Consumer Health, Inc. v. Johnson & Johnson-Merck Consumer Pharm.*, 290 F.3d 578, 596 (3d Cir. 2002).

C. No Third Parties Will Be Harmed If There is A Stay

Granting a temporary stay of the trailer standards would not cause harm to third parties because the trailer standards, even if implemented, would achieve little if any benefit to global climate change. This is because trailer manufacturers *already* install and sell the mandated technologies where those technologies are most likely to improve fuel economy and thereby reduce GHG emissions. The motor carrier industry is an extremely competitive, low-margin industry that is particularly sensitive to fuel costs and trailer weight (which impacts the amount of cargo the tractor-trailer combination can haul in light of the 80,000-pound weight limit). Consequently, motor carrier customers already pressure their trailer manufacturer suppliers to

install low-rolling resistance tires and aerodynamic equipment where the nature of their trucking operations will enable them to realize measureable fuel savings, and to reduce trailer weight where cost-effective to enable them to haul additional cargo.

Thus, because trailers are used in a variety of applications, trailer manufacturers must customize the trailers they manufacture and sell to meet their customers' specific needs. Market forces already dictate that trailer manufacturers install and sell technologies designed to reduce aerodynamic drag and road friction for applications in which such technologies are likely to materially improve fuel economy (and thus GHG emissions performance). For trailers used in long-haul applications, for example—where the tractor-trailer combination will travel long distances at high speeds—these technologies can have a significant impact on fuel consumption. A customer operating a truck fleet engaged in long-haul operations thus has a significant incentive to demand aerodynamic and friction-reducing technologies on its trailers to reduce overall fuel costs.

In contrast, aerodynamic and friction-reducing technologies do not materially reduce fuel consumption or GHG emissions during short-haul operations at lower speeds (*e.g.*, in-city deliveries, food service, etc.). For these applications, customers typically do not request, and trailer manufacturers do not install, aerodynamic and friction-reducing technologies because the costs of doing so significantly outweigh any potential benefits. The trailer standards, however, would mandate that trailer manufacturers install and sell these technologies on nearly all heavy-duty trailers, including those designated for short-haul operations. The trailer standards thus create compliance costs for trailer manufacturers and their customers without providing corresponding fuel economy or GHG benefits to third parties and the environment. Indeed, the added weight of the aerodynamic equipment in those operations will cause *greater* fuel consumption and *increased* GHG emissions.

In short, because the trailer standards provide no demonstrable benefit to third parties or the environment beyond what the trailer industry already is achieving due to market forces, this factor weighs in favor of granting a stay.

D. A Stay is In the Public Interest

Staying the effective date of the Final Rule's trailer standards also is in the public interest. If the trailer standards remain in effect during the pendency of judicial review, they will impose substantial compliance costs on regulated entities that cannot be recouped, without providing any material benefit to the general public or the environment. As addressed above, trailer manufacturers already install and sell aerodynamic and friction-reducing technologies where such technologies are likely to achieve GHG and fuel economy benefits. The Agencies have not demonstrated that mandating trailer manufacturers to install and sell such technologies on additional trailers—beyond what the trailer industry already is doing—will benefit the public. Indeed, as described above, the new trailer standards actually will have the opposite effect—they will needlessly force manufacturers to add heavy aerodynamic devices to their trailers, thereby displacing cargo and resulting in more trips to deliver the same amount of cargo, leading to increased fuel consumption, increased emissions, and increased trucking accidents in the United States. With negligible benefits for global climate change even when calculated by the

Agencies on a global basis, the American public must bear these additional costs and indeed at least several additional fatalities due to the need for more trucks on the Nation's roads to carry the same total cargo. This is contrary to the interest of the American public.

CONCLUSION

In sum, EPA and NHTSA should reconsider and rescind the GHG and fuel economy standards for heavy-duty truck trailers because such trailers are not motor vehicles and so the agencies lack authority impose such regulations on them. Even if the agencies did have such authority, they should reconsider and rescind these regulations because they arbitrarily impose requirements without properly considering whether additional aerodynamic equipment is productive at the speeds these trailers are hauled or the additional weight of such equipment that displaces cargo that must then be carried by additional trailers. Finally, EPA should immediately stay the effect of its GHG requirements for trailers, which are causing immediate and irreparable harm as trailer manufacturers must now take steps to comply with these rules for Model Year 2018.

EXHIBIT D

E. SCOTT PRUITT
ADMINISTRATOR

August 17, 2017

Mr. Jonathan S. Martel
Arnold & Porter Kaye Scholer LLP
601 Massachusetts Avenue, NW
Washington, D.C. 20001-3743

Mr. Jeffrey M. Sims, President
Truck Trailer Manufacturers Association
7001 Heritage Village Plaza, Suite 220
Gainesville, Virginia 20155

Dear Mr. Martel and Mr. Sims:

On April 3, 2017, Mr. Jeffrey Sims sent a letter on behalf of the Truck Trailer Manufacturers Association to the U.S. Environmental Protection Agency asking the EPA to reconsider and issue an administrative stay of the greenhouse gas emission standards for heavy-duty truck trailers in the final rule entitled “Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2” (81 FR 73478, October 25, 2016) (“Phase 2 Rule”). On June 26, 2017, Mr. Jonathan Martel submitted a supplemental petition for reconsideration and stay on behalf of TTMA. In these letters, TTMA questioned the EPA’s authority under the Clean Air Act to regulate truck trailers as well as the EPA’s analysis of the costs and benefits of the standards. More specifically:

- TTMA noted that the Clean Air Act definition of “motor vehicle” refers to “self-propelled” vehicles, and TTMA challenges the EPA’s authority to regulate truck trailers because they are not self-propelled.
- TTMA challenges the EPA’s authority to regulate truck trailers as incomplete motor vehicles.
- TTMA disputes the EPA’s projection of greenhouse gas and fuel economy benefits because of concerns about the vehicle speed profile assumed by the EPA.
- TTMA projects that weight of the new emission components will decrease available payload which would cause an increase in the number of trucks on the road. TTMA estimates that this would increase both greenhouse gas emissions and fatal crashes.

In light of these issues, the EPA has decided to revisit the Phase 2 trailer provisions in general, and the issue of the EPA's authority to regulate trailers in particular. We intend to develop and issue a Federal Register notice of proposed rulemaking on this matter, consistent with the requirements of the Clean Air Act.

The EPA has made no decision at this time regarding your request for an administrative stay.

If you have any questions regarding our response, you may contact Bill Charmley in the Office of Transportation and Air Quality at (734) 214-4466.

Respectfully Yours,

E. Scott Pruitt

**IN THE UNITED STATES COURT OF APPEALS
FOR THE DISTRICT OF COLUMBIA CIRCUIT**

TRUCK TRAILER MANUFACTURERS
ASSOCIATION, INC., *et al.*,

Petitioners,

v.

UNITED STATES ENVIRONMENTAL
PROTECTION AGENCY, *et al.*

Respondents,

and

CALIFORNIA AIR RESOURCES BOARD,
et al.,

Intervenors.

No. 16-1430 (consolidated with
No. 16-1447)

**DECLARATION OF JEFF SIMS IN SUPPORT OF TRUCK TRAILER
MANUFACTURERS ASSOCIATION, INC.'S MOTION FOR STAY**

I, Jeff Sims, declare as follows:

1. I am President of the Truck Trailer Manufacturers Association, Inc. (TTMA). I have held this position since July 2010, having previously served as TTMA's Engineering Manager since November, 2000. Before coming to TTMA, I worked for 13 years and became a terminal manager for Watkins Motor Lines, Inc., a large interstate motor carrier that is now part of FedEx Corporation. Watkins Motor Lines operated hundreds of heavy-duty trucks, commonly known as tractor-trailers or combination truck trailers.
2. TTMA's members manufacture over 90% of the heavy-duty trailers in use in the United States. We have over 70 members that manufacture trailers in over 150 plants located in over 30 different states, plus a few that manufacture in Canada or Mexico and import their products into the United States. To my knowledge, only one of these manufacturers is a publicly-traded company. Most are closely-held, family-owned businesses. The customers who buy these heavy-duty trailers include cargo shippers, motor carrier fleets and independent owner-operators who together move nearly all of the Nation's commercial truck freight.

3. TTMA assists our trailer manufacturer members by providing a forum in which important information affecting trailer design and operation can be shared. Our engineering committee develops and the association publishes recommended practices that promote safety and consistency in design and operation where needed. For example, since the vast majority of trailers are not built for permanent assignment to be towed by a single specific tractor, the connections between tractors and trailers must be reliably interchangeable so that operators can “drop” one trailer where it can be loaded, or unloaded, and “hook” to another trailer and tow it in the meantime. These drop-and-hook deliveries represent the overwhelming majority of trucking operations today.
4. TTMA also monitors rulemaking by federal and state agencies as it pertains to trailer design and use. We keep our members apprised of those developments, and we provide a conduit for gathering information requested by the agencies and commenting on proposed rules. We represent our trailer manufacturer members before these agencies through membership votes on particular issues and through directives from our Board of Directors, who are elected by our

members. In the present matter, our membership and our Board of Directors voted to petition the Court to review the trailer provisions contained within the “Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles—Phase 2” (GHG2 Standards) issued by the United States Environmental Protection Agency (EPA) and the National Highway Traffic Safety Administration (NHTSA) on August 16, 2016, and published in the Federal Register on October 25, 2016. Each of TTMA’s trailer manufacturer members has been affected by the GHG2 Standards, which impose planning, labeling and reporting obligations on all manufacturers regardless of size, and which will require installation of various configurations of EPA certified tires, tire inflation and monitoring systems, and aerodynamic side skirts and trailer tails beginning for large manufacturers in January, 2018, and for the remaining manufacturers in January, 2019. Our manufacturer members must comply with these obligations even if their customers, who will purchase and operate the trailers, do not want these devices and will not achieve any fuel-saving benefits from them.

5. The trailers manufactured by TTMA members are towed by Class 8

tractors or other heavy trucks and are therefore not equipped with engines for self-propulsion. Since most trailers are used in drop-and-hook operations, their aerodynamic features cannot be designed to maximize fuel efficiency with all of the possible tractor designs. Moreover, some trailers may be used primarily in long-haul operations with most of the travel time at highway speeds, while many other trailers may be used predominantly for local or regional deliveries at slower, stop-and-go speeds. Depending on a motor carrier's freight commitments, some trailers "cube out" before they "weigh out," meaning the cargo completely fills the interior of the trailer before the maximum 80,000-pound weight limit is reached for the combined weight of the tractor, trailer and cargo. Other trailers "weigh out" with dense, heavy cargo. For those that are usually operated in "weigh out" conditions, the addition of several hundred pounds of GHG equipment will require that some cargo be removed from the trailers and transported on other trailers. This will increase the number of tractor-trailers traveling on the nation's highways in order to move the same amount of freight, which will increase fuel consumption and increase the number of truck-involved accidents.

6. My understanding is that fuel typically is the largest expense, or second largest expense behind labor costs, that motor carrier fleets incur. Motor carriers therefore have a direct and immediate incentive to utilize fuel-saving technologies where benefits can be achieved in their operations. For aerodynamic side skirts and trailer tails, for example, “truckload carriers” are likely to install this equipment if they travel long distances, mostly at highway speeds, and make a single delivery. In those operations, the aerodynamic devices have been shown to reduce drag and save fuel. By contrast “less-than truckload” carriers make frequent stops and travel at slower speeds between deliveries. For these operations, the aerodynamic equipment is not effective and merely adds deadweight to the trailer, actually increasing fuel consumption. Because fuel is such a significant cost to motor carriers, trailer manufacturers *already* install and sell the GHG2 technologies where those technologies are most likely to improve fuel efficiency.
7. In sum, the motor carrier industry is an extremely competitive, low-margin industry that is particularly sensitive to fuel costs and trailer weight. Trailer purchasers already pressure their trailer manufacturer

suppliers to install low-rolling resistance tires and aerodynamic equipment where the nature of their trucking operations will enable them to realize measureable fuel savings, and to reduce trailer weight where cost-effective to enable them to haul additional cargo. Market forces already dictate that trailer manufacturers install and sell technologies designed to reduce aerodynamic drag and road friction for applications in which such technologies are likely to materially improve fuel economy (and thus GHG emissions performance). Recognizing these market forces, TTMA has long participated in, and has supported, the EPA Smartway program, which tests new devices for fuel savings and publishes the results so fleets can decide whether using these devices in their operations will produce a net benefit. This is a voluntary program that does not disrupt free-market incentives and it should continue without the mandates that the GHG2 Standards will impose without regard to actual trailer use.

8. I have been informed by many of our manufacturer members—including, for example, three of the largest manufacturers (Wabash National, Great Dane and Utility Trailer), a smaller manufacturer (Kentucky Trailer) and a foreign manufacturer (Hyundai Translead),

among others—that they are already experiencing disruptions in their negotiation of orders for new trailers to be produced and sold in 2018. Our trailer manufacturers are having difficulty sourcing GHG2 compliant equipment and therefore cannot commit to new orders with certainty that the trailers will comply with the GHG2 Standards. They cannot cover all non-compliant trailers by using the limited exemptions available under the new standards. Many manufacturers are declining requests to build trailers without the GHG2 equipment, and are likely to lose sales as a result. All of this is adversely affecting the goodwill that exists between trailer manufacturers and their customers, as the manufacturers are compelled to force their customers to purchase GHG2 equipment that they do not want and that will not produce a net benefit in fuel savings. No regulation requires the customers to buy this equipment, but the manufacturers are in the position of having to force them to buy it, operate it, and maintain it. Our manufacturer members are also incurring substantial administrative costs as they must prepare to comply with the GHG2 Standards, plus the cost of restructuring manufacturing facilities and processes to enable them to install GHG2 equipment on nearly all

new trailers and the cost of building new warehouse space for storing GHG2 equipment inventory, which they must order and have on hand before 2018 in order to comply with the new standards. TTMA believes these costs and disruptions should not be imposed on the trailer manufacturers while our petition is under review by this Court. We are therefore asking for a stay. I thank the Court for considering this request.

I declare under penalty of perjury under the laws of the United States that the foregoing is true and correct.

Executed in Gainesville, Virginia, on September 21, 2018.

**IN THE UNITED STATES COURT OF APPEALS
FOR THE DISTRICT OF COLUMBIA CIRCUIT**

TRUCK TRAILER MANUFACTURERS
ASSOCIATION, INC., *et al.*,

Petitioners,

v.

UNITED STATES ENVIRONMENTAL
PROTECTION AGENCY, *et al.*

Respondents,

and

CALIFORNIA AIR RESOURCES BOARD,
et al.,

Intervenors.

No. 16-1430 (consolidated with
No. 16-1447)

**DECLARATION OF ROBERT MAKI IN SUPPORT OF TRUCK TRAILER
MANUFACTURERS ASSOCIATION, INC.'S MOTION FOR STAY**

I, Robert Maki, declare as follows:

1. From 1969 to the present, except for military service from 1973-1976, Utility Trailer Manufacturing Company [**“Utility Trailer”**] employed me in connection with its manufacturing operations in the following capacities:

- a. Trailer assembler and welder: 1969 – 1973
- b. Production supervisor: 1976 – 1981
- c. Plant manager: 1981 – 2002
- d. Director of Manufacturing: 2002 - 2016

Currently, I work on special projects for Utility Trailer.

2. Based on my forty-five years of experience at Utility Trailer, I am familiar with Utility Trailer’s manufacturing process, ordering process, requirements for procuring parts and components needed to manufacture trailers, and the lead-times involved in ordering, producing, and delivering trailers to Utility Trailer’s customers.

3. Utility Trailer is a member of the Truck Trailer Manufacturers Association [**“TTMA”**], which has sued the United States EPA and National Highway Traffic and Safety Administration [collectively, **“Agencies”**] to invalidate the Agencies’ final rule **“Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2”** [**“Final Rule”**] insofar as the Final Rule applies to trailers. The Final Rule will take effect for all heavy-duty trailers manufactured on or after January 1, 2018.

4. The Final Rule will require Utility Trailer to add significant equipment – some combination of low-rolling-resistance tires, side skirts, tire-inflation or tire-

pressure-monitoring systems, boat tails, or aerodynamic devices that attach to the rear, side, top, or underside of the trailer – to virtually all trailers it manufactures.

5. Utility Trailer will be severely prejudiced unless the Court stays implementation of the Final Rule pending the Court’s decision in the litigation. This prejudice, as specified in the following paragraphs, is caused by

- Utility’s designing and building trailers that comply with the Final Rule but that its customers ultimately will not want to purchase;
- Slowing production rates;
- Constructing storage facilities for myriad components and parts required by the Final Rule;
- Incurring transportation costs associated with delivering these parts and components;
- Acquiring additional trailers to transport the parts and components to Utility Trailer’s factories;
- Designing its trailers to accommodate the equipment required by the Final Rule;
- Hiring additional corporate personnel and obtaining information-technology infrastructure to make certain that all ordered and manufactured trailers comply with the Final Rule; and
- Hiring additional factory workers to install the equipment required by the Final Rule.

6. Utility Trailer is the country’s largest manufacturer of refrigerated trailers and the nation’s third-largest trailer manufacturer. Founded in 1914, Utility Trailer is a family-owned and- run business selling tens of thousands trailers annually that would be subject to the Final Rule, if that Final Rule remains applicable to trailers. The

overwhelming majority of Utility Trailer's sales are highly customized trailers, with customers ordering trailers designed for the specific use to which the customer will put the trailer. Within very broad limits and governmental regulations, customers specify the trailer's characteristics. For example, customers specify the trailer's length or width; the thickness of the refrigerated trailer's walls, floor, and roof; the material used to construct the trailer's exterior and interior; the brand and characteristics of the tires; the trailer's floor type and material; the trailer's suspension, wheels, brakes, axles, and related components; the types of aerodynamic devices to be included; and hundreds of other options – both published and unpublished. Some of those options – particularly low-rolling-resistance tires, automatic tire-inflation systems, tire-pressure-monitoring systems, side skirts, boat tails, and other aerodynamic devices attached to the top, underside, rear, or side of the trailers – are those that the Final Rule requires.

7. Although many of Utility Trailer's customers order some of the devices that are among those required to comply with the Final Rule, many of trailers currently ordered by Utility Trailer's customers would not comply with the Final Rule's requirements.

8. Utility Trailer's customers plan for purchasing and ordering trailers months before Utility Trailer manufacturers the trailers. Orders for trailers are usually placed months before Utility Trailer delivers the ordered trailers. Typically, discussions with customers for trailers to be manufactured in the next calendar year start in May, and customers begin placing orders in the summer months for trailers to be manufactured in the first quarter of the ensuing calendar year.

9. Unless the Final Rule is stayed pending a decision in this litigation, Utility Trailer must plan to build trailers beginning on January 1, 2018, that have all the

equipment and options necessary for those trailers to comply with the Final Rule. This means that for all orders for trailers manufactured after January 1, 2018, customers must include in their orders the equipment and options necessary to comply with the Final Rule, regardless of whether the customers would purchase that equipment if the Final Rule were not in place.

As noted previously, history demonstrates that customers generally do not order trailers with all the equipment and options the Final Rule requires; rather, customers order options and equipment that will be useful in anticipated application. Customers apparently perceive that many of the Final-Rule-required options and equipment are not cost-justified, especially in non-over-the-road applications. More specifically, a number of Utility Trailer's customers involved in regional applications and city deliveries have expressed dissatisfaction with the low-rolling-resistance tire offerings because they will encounter significantly greater wear in those regional applications; similarly, a number of larger customers have said they are not interested in purchasing tires with the shallow-tread associated with the low-rolling-resistance offerings. Other customers, who do not anticipate any significant aerodynamic benefits from side-skirts, have requested devices or options for which the third-party manufacturers have not yet been able to supply EPA certification. As a result, Utility Trailer cannot assure its customers that it will be able to build the trailers the customers wish to order, since Utility Trailer after January 1 can only lawfully build trailers that comply with the Final Rule, and EPA-certification of the aerodynamic devices and low-rolling-resistance tires is required for compliance.

As a result of customers' perceived lack of benefit from the aerodynamic devices, as well as the perception that low-rolling-resistance tires will significantly increase tire wear, and thus costs, Utility Trailer anticipates that customers may delay ordering trailers until either the EPA amends its Final Rule to exempt trailers, or this Court issues a final

ruling as to whether the EPA exceeded its authority in including trailers within the Final Rule. Utility Trailer anticipates that it will suffer losses – both from delay and from lost orders – as a result that it will not be able to recoup.

10. To build Final-Rule-compliant trailers on and after January 1, 2018, Utility Trailer will be required to enter agreements with its suppliers to secure suitable quantities of the required equipment and options. But for the Final Rule, Utility Trailer would not enter those arrangements. If the TTMA's challenge to the Final Rule succeeds, Utility Trailer will have committed to purchase (and depending upon when a decision on the challenge is provided, may have taken delivery of) significant quantities of options and equipment that it has no ability to sell. And for the options and equipment that it will ultimately sell, Utility Trailer estimates that it will have to store those items for an extended period until the ordered quantities are used in the normal course of its business, incurring both storage and carrying costs.

11. Similarly, if the Court sustains TTMA's challenge to the Final Rule after a customer places an order for a trailer that includes the Final-Rule-required equipment and options, Utility Trailer (and other manufacturers) will receive significant pressure from the customers to change the manufacturing specifications of the ordered trailers. This would add to the quantity of Final-Rule-required options and equipment that Utility Trailer will have ordered but is not able to sell and must store and carry on its books.

12. Utility Trailer will need to build up its inventory of myriad equipment and options required by the Final Rule and store that inventory. This will require Utility Trailer to construct additional storage buildings at four of its factories. Utility Trailer estimates that each storage building would be approximately 60' x 120' in area. At an average construction cost of \$85/ft.², each building would cost approximately \$612,000,

for a total cost of \$2,448,000. Assuming all trailers built after January 1, 2018, must comply with the Final Rule, Utility Trailer must commence construction of storage facilities within the next two months, with planning beginning in roughly the next month. Utility Trailer would not construct these additional buildings except for the need to comply with the Final Rule, and it will not require these buildings if the Court ultimately invalidates the Final Rule as it applies to trailer manufacturers as requested in the TTMA's litigation.

13. Utility Trailer will need to hire additional employees to comply with the Final Rule. Utility Trailer anticipates that it will need an additional 56 employees in its four van plants to handle and install the additional equipment required by the Final Rule. Additionally, Utility Trailer estimates it will require 3 – 4 additional personnel in its corporate office to manage compliance with the Final Rule's various certification and reporting requirements, and to make certain that the thousands of manufacturing variations requested by customers are manufactured with options that comply with the Final Rule, and that the manufactured trailers are tracked in a way that allows appropriate reporting to the Agencies. Utility Trailer estimates that fully loaded costs of the additional personnel will exceed \$5,000,000. Utility Trailer anticipates that it will need to begin the hiring process for the corporate personnel within the next month and in the mid- to late-autumn for the factory workers. Utility Trailer also will need to modify and upgrade its information-technology support for inventory, equipment handling, and trailer ordering, all at additional cost.

14. Utility Trailer also will incur additional handling and logistical costs in connection with procuring the Final-Rule-required options and equipment. These costs include inevitable damage to the parts and equipment during transport and storage, transportation costs associated with bringing the options and equipment to its factories,

purchasing trailers that will be dedicated to transporting the options and equipment and options from the manufacturers of those components to the factories. Utility Trailer has not computed the damage and transportation costs associated with handling and logistics. The cost for additional trailers, however, likely will exceed \$500,000.

15. Utility Trailer will incur non-recoverable costs attributable to assembly-line modifications and slowdowns and bottlenecks in trailer production as customers use different aerodynamic devices to meet the Final Rule's requirements. Utility Trailer has designed and obtained EPA approval for its own side skirt. Because it anticipates that a majority of customers will purchase that skirt, Utility Trailer is planning to modify its assembly lines so that its skirt can be installed as part of the normal production process. But discussions to date with Utility's customers, as well as experience, indicates that a substantial minority of customers will purchase trailers with third-party side skirts. The layout of Utility's factories will not accommodate installation of these third-party skirts on the assembly line, as there is not enough storage adjacent to the line to keep myriad side-skirt products adjacent to the line. Utility Trailer therefore will install those third-party products in its separate modification shop after the trailer leaves the assembly line. This will result in additional costs associated with moving and storing the trailer as it waits for a spot in the modification shop to open up for installation, as well as delays in delivering trailers as Utility Trailer does not have sufficient current capacity in its modification shops to accommodate a significant increase in third-party side-skirt installation. Utility Trailer does not have enough information at this time to determine whether it will need to expand its modification operations to accommodate an increase in end-of-the-line installation of aerodynamic devices. Expansion of its facilities will incur significant building and construction costs, which Utility Trailer has not yet quantified. At a minimum, Utility Trailer will experience significant delays in production,

dislocations, and bottlenecks as it attempts to accommodate the different requirements dictated by its customers for aerodynamic devices manufactured by various parties.

16. Finally, Utility Trailer will incur additional, non-recoverable costs in designing and engineering packages that combine the myriad available options necessary to produce a fully Final-Rule-compliant trailer. Utility Trailer has not yet attempted to compute the costs it will incur because of this design work and production slowdown.

I declare under penalty of perjury under the laws of the United States that the foregoing is true and correct. Executed in Alta Loma, California, on September 20, 2017.

EXHIBIT G

**IN THE UNITED STATES COURT OF APPEALS
FOR THE DISTRICT OF COLUMBIA CIRCUIT**

TRUCK TRAILER MANUFACTURERS
ASSOCIATION, INC., *et al.*,

Petitioners,

v.

UNITED STATES ENVIRONMENTAL
PROTECTION AGENCY, *et al.*

Respondents,

and

CALIFORNIA AIR RESOURCES BOARD,
et al.,

Intervenors.

No. 16-1430 (consolidated with
No. 16-1447)

**DECLARATION OF GLENN HARNEY IN SUPPORT OF TRUCK
TRAILER MANUFACTURERS ASSOCIATION, INC.'S MOTION FOR
STAY**

I, Glenn Harney, declare as follows:

1. I am Chief Sales Officer for Hyundai Translead, Inc., based in its corporate headquarters located in San Diego, California. Hyundai Translead manufactures heavy-duty trailers for the North American market in three manufacturing facilities located in Baja California, Mexico. I have been a Hyundai Translead employee since 2002. I have worked in the trailer manufacturing industry since 1972, first with Fruehauf Corporation and later with HPA Monon Corporation, both of which also manufactured heavy-duty trailers.
2. I am familiar with the new greenhouse gas emissions and fuel economy standards for trailers (GHG2 Standards), which were jointly issued by the United States Environmental Protection Agency (EPA) and the National Highway Traffic Safety Administration (NHTSA). I also have direct knowledge of how the impending implementation of those standards is affecting Hyundai Translead's manufacturing operations and its sales of new trailers for delivery in 2018.
3. Hyundai Translead is a member of the Truck Trailer Manufacturers Association (TTMA). I know that TTMA has filed a petition in the District of Columbia Circuit Court of Appeals, challenging among

other things the statutory authority asserted by EPA and NHTSA for issuing the GHG2 Standards. TTMA and its members, including Hyundai Translead, are requesting that the Court of Appeals stay implementation of the GHG2 Standards while that review takes place. I offer this affidavit in support of TTMA's request for a stay.

4. Hyundai Translead is a large manufacturer under the new regulations, and the administrative costs of compliance will be substantial if the GHG2 Standards are implemented as currently scheduled in January, 2018. Each trailer order must be evaluated for installation of specific GHG2 equipment, each trailer must be labeled to show the specific equipment installed, and each trailer must be tracked for reporting purposes. We are having to divert, hire and train the equivalent of at least three employees, who will be dedicated to the tasks of compliance, record-keeping and reporting. We are also incurring the cost of hiring another engineer, who will be responsible for developing the necessary GHG2 equipment packages unique to each trailer model and purchase order, as our products are highly customized on an order-by-order basis. We will not have to incur these costs if implementation of the GHG2 Standards is stayed.

5. Hyundai Translead is now taking orders for production in 2018. If there is no stay of the GHG2 Standards, Hyundai Translead will have to install aerodynamic equipment on nearly all trailers manufactured in 2018. Many of our customers have indicated that they do not want the equipment because it will not produce fuel savings in their operations.
6. We are incurring additional costs even when we are able to sell trailers without the GHG2 equipment. One customer, for example, has placed an order for up to 2,500 trailers for delivery in 2018, but only if they can be delivered without the GHG2 equipment that would otherwise be required by the new standards. We are now making arrangements to produce those trailers and import them into the United States before January 1, 2018. But then we will have to park, store and insure those trailers until our customer accepts delivery and pays for them on a schedule that extends into April, 2018. Although EPA has given us advance approval of this arrangement, our storage costs will exceed \$10 per day per trailer – and in total will exceed \$1 million. This is a direct cost that will be incurred if implementation of the GHG2 Standards is not stayed. This sale to a single customer

demonstrates the magnitude of the resistance we are encountering with our customers who know their operating costs, know whether the GHG2 equipment will produce any net fuel savings in their operations, and are unwilling to purchase the equipment if there will be no net benefits. Otherwise forcing the purchase of that equipment onto unwilling customers will clearly impose costs on both trailer manufacturers and the trucking companies that operate the new trailers. These costs will not be recoverable if the Court does not stay implementation of the GHG2 Standards and then later holds that the standards were not properly issued.

I declare under penalty of perjury under the laws of the United States that the foregoing is true and correct.

Executed in San Diego, CA., on September 23, 2017.

GLENN HARNEY

Intervenors.

No. 16-1430 (consolidated with
No. 16-1447)

**DECLARATION OF DANIEL E. CARTER IN SUPPORT OF TRUCK
TRAILER MANUFACTURERS ASSOCIATION, INC.'S MOTION FOR
STAY**

I, Daniel E. Carter, declare as follows:

1. I am Director of Product Safety and Compliance for Great Dane LLC in Savannah, Georgia. I have worked as an engineer on the design and manufacture of Great Dane trailers for 35 years. I have extensive knowledge of the highly customized nature of our customers' orders for new trailers. I am responsible for Great Dane's compliance with the new greenhouse gas emissions and fuel economy standards for heavy-duty trailers (GHG Phase 2 Rules) issued by the Environmental Protection Agency (EPA) and the National Highway Traffic Safety Administration (NHTSA).
2. For many months, I have been working with Great Dane's design engineers, production engineers, sales representatives and outside vendors to understand the requirements and impacts of the GHG Phase 2 Rules. Our trailers are made-to-order, and the lead time for production is approximately six months. We are currently taking orders for production in the first quarter of 2018. The GHG Phase 2 Rules are scheduled to begin applying to trailers manufactured on or after January 1, 2018. We are now receiving customer feedback on our efforts to develop trailer designs and options that will comply

with these new rules. We are continuing our attempts to locate vendors to supply EPA-certified equipment that can be installed on our trailers to meet the new requirements. We are also incurring substantial costs as we (1) engineer the application of these options to our various trailer models, (2) train our sales representatives about these options and the necessity of installing specific combinations of GHG equipment even though a customer does not want to purchase it, (3) develop a compliance program for labeling every trailer to show the original GHG equipment, and track every sale in order to certify compliance on an annual basis to the EPA, and (4) prepare our manufacturing plants for installation of the required GHG equipment.

3. Great Dane is a member of the Truck Trailer Manufacturers Association, which has requested review and rescission of the trailer provisions in the GHG Phase 2 Rules. This affidavit is submitted in support of TTMA's request that the Court stay implementation of the GHG Phase 2 Rules applied to trailers. Great Dane is incurring costs and experiencing customer dissatisfaction as a consequence of the impending January 2018 implementation date. These losses and injuries will not be recoverable if EPA and NHTSA or if the court

later agrees with TTMA that the rules were not properly issued by the agency.

4. Our relationships with customers are being adversely affected by implementation of the GHG Phase 2 Rules. Our sales representatives are encountering resistance to the forced purchase of GHG equipment on trailers that customers have previously not wanted to buy. Our sales representatives are now rejecting on a regular basis purchase order requests for trailers not equipped with GHG equipment. We will likely lose sales as a result. We are also finding it difficult to source certain GHG equipment. One example: For one of our major regular customers (which orders approximately 200 new trailers each year), we are unable to source an EPA-certified low rolling resistance tire for the unique wheel size used in this customer's fleet. The tires previously used by this customer do not meet the requirements for certification. We will not have enough exemptions under the GHG Phase 2 Rules to accommodate all of Great Dane's customers who order similar trailers or otherwise require trailer configurations that must be labeled as exempt, and we have therefore been unable to issue a quote for new trailers to this customer. We are likely going to

lose some or all of our annual sales to this customer due to implementation of the GHG Phase 2 Rules starting in January if that implementation is not stayed.

5. Among the many compliance costs, is the cost that Great Dane will have to incur to construct warehouse space for storage and handling of the GHG equipment (side skirts and trailer tails) that will have to be installed on nearly all of our trailer production beginning in January, 2018. We anticipate the cost for adding these storage areas to Great Dane's eight manufacturing plants to total approximately \$2 million. We would not otherwise construct – or need – these storage areas if the GHG Phase 2 Rules were not implemented.

I declare under penalty of perjury under the laws of the United States that the foregoing is true and correct. Executed in Savannah, Georgia, on September 19, 2017

Intervenors.

No. 16-1430 (consolidated with
No. 16-1447)

**DECLARATION OF GEORGE GAUNTT IN SUPPORT OF TRUCK
TRAILER MANUFACTURERS ASSOCIATION, INC.'S MOTION FOR
STAY**

I, George Gauntt, declare under penalty of perjury under the laws of the United States that the following is true and correct:

1. I am Director of Product Innovation at Kentucky Trailer based in Louisville, Kentucky. Our company manufactures specialty heavy-duty trailers for, among others, the household moving industry, mobile medical and broadcast markets, vehicle transportation, and unique government projects. I have worked for Kentucky Trailer for over 17 years and previously served as Director of Engineering. I am responsible for Kentucky Trailer's compliance with Phase 2 of the greenhouse gas emissions and fuel economy standards for trailers (GHG2 Standards) that were recently issued by the Environmental Protection Agency ("EPA") and the National Highway Traffic Safety Administration ("NHTSA").
2. Kentucky Trailer is a member of the Truck Trailer Manufacturers Association ("TTMA"). I am submitting this affidavit in support of TTMA's request for a stay of the January 1, 2018 implementation date for the GHG2 Standards for heavy-duty trailers. The costs and dislocations of implementing those standards are substantial and cannot be recovered by Kentucky Trailer if there is no stay and the

Court later determines that EPA and NHTSA did not properly issue the standards.

3. The administrative burdens of complying with the GHG2 Standards will be substantial. We are in the process of completing the following tasks, which could be suspended if the Court enters a stay:

Forecast the number of trailers of each family that we believe we will build in the upcoming year. This takes extra manpower to compile and communicate to EPA.

Each trailer family then has to be certified (and re-certified each year), which takes extra manpower.

Gather tire rolling resistance numbers from tire manufacturers, which is not an easy task since this is considered proprietary and confidential information by the tire manufacturers.

Maintain confidential nature of tire rolling resistance numbers even though this is needed to comply with regulations.

Find a way to convey to our customers which tires can be used for replacement when this is considered confidential information.

Label each trailer by serial number with which GHG2 features were installed. This takes extra manpower to track and ensure that each label is correct for every model of trailer and serial number going down the line.

Create special maintenance procedures for all new GHG2 equipment, which requires extra manpower to compile, review and keep up to date.

Create special warranty policies for all new GHG2 equipment, which requires extra manpower to create, compile, review and keep up to date.

Recordkeeping:

- a. By serial number track the required GHG2 features used on each trailer, which requires extra manpower to track, compile, and retrieve for year-end reporting.
- b. Maintaining records for 8 years.

Year-end reporting to reconcile actual production by trailer family to forecast.

We are having to divert administrative personnel from other responsibilities to complete these tasks. The additional time our staff is spending to compile, track and record data to ensure compliance totals the equivalent of nearly one full-time staff member's time for an entire year.

4. For most of our drop frame trailer designs, which are widely used in the household moving industry, aerodynamic side skirts are not yet tested and certified, so as the only practical and the least expensive alternative, we will have to install trailer tails on nearly all of these trailers in order to comply with the GHG2 Standards. These devices

are widely unpopular with our customers. To accommodate the trailer tail devices, we have had to redesign the rear doors on these trailers, even though our current design is much better and is preferred by our customers. In addition, many customers order decals for the trailer rear doors as advertising features. These decals will have to be reworked to fit the new trailer designs. And our manufacturing processes will have to be restructured in order to install the trailer tails after the decals. This installation will have to be done in our paint shop and will require substantial additional labor costs that would not be incurred if the tails were installed during trailer assembly. Simply put, our trailers will be more difficult to produce, they will cost more to produce, and they will have features that our customers do not want. We could avoid these disruptions if the Court entered a stay of the January 2018 implementation date for the GHG2 Standards.

5. We are also encountering difficulties in sourcing low rolling resistance (“LRR”) tires that will satisfy the GHG2 Standards and meet our customer applications. For some small diameter wheels, which are used extensively on drop frame trailer designs, the

available GHG2 certified LRR tires will underperform on trailers, such as moving vans, which make frequent tight turns in residential neighborhoods in order to make deliveries. The scrubbing that occurs during such turns, combined with the rubber composition of LRR tires, will cause greater tire wear and require more frequent tire replacement. The wear characteristics of the available LRR tires simply do not perform well in that application or in similar regional trucking operations, as compared to long-haul operations, and yet the GHG2 Standards will require that we only offer those tires.

6. As a result of considerations like these, we are encountering customer dissatisfaction. We are having to reject orders for new trailers that do not include the necessary GHG2 equipment. In addition, the GHG2 equipment is expensive, adding as much as several thousands of dollars additional cost to each trailer (plus Federal Excise Tax). Our customers are not happy with the price increases. Motor carrier fleets that have set annual budgets for new trailer purchases are not able to purchase as many trailers as in years past. When we make fewer trailers, we need fewer workers or fewer hours worked. We could avoid any dislocation in our production schedules if implementation

of the GHG2 Standards is stayed.

Dated and signed on September 22, 2018.

**IN THE UNITED STATES COURT OF APPEALS
FOR THE DISTRICT OF COLUMBIA CIRCUIT**

TRUCK TRAILER MANUFACTURERS
ASSOCIATION, INC., *et al.*,

Petitioners,

v.

UNITED STATES ENVIRONMENTAL
PROTECTION AGENCY, *et al.*

Respondents,

and

CALIFORNIA AIR RESOURCES BOARD,
et al.,

Intervenors.

No. 16-1430 (consolidated with
No. 16-1447)

**DECLARATION OF JAMES SCARCELLI IN SUPPORT OF TRUCK
TRAILER MANUFACTURERS ASSOCIATION, INC.'S MOTION FOR
STAY**

I, James Scarcelli, declare as follows:

1. I am Vice President for Corporate Strategy and Governmental Affairs at Wabash National Corporation. I have worked for Wabash National since 2002. From 2008 to 2015, I was in charge of developing and promoting Wabash National's participation in the Environmental Protection Agency's (EPA's) SmartWay program for verified fuel saving technologies on heavy-duty trailers. SmartWay is a voluntary program for our motor carrier customers that we continue to support. Since 2010, I have monitored federal rulemaking as it pertains to Wabash National products, including specifically Phase 2 of the greenhouse gas emissions and fuel economy standards for trailers (GHG2 Standards), which were jointly issued by EPA and the National Highway Traffic Safety Administration (NHTSA).
2. Wabash National is a member of the Truck Trailer Manufacturers Association (TTMA). I am aware that TTMA has filed a petition in the District of Columbia Circuit Court of Appeals, challenging among other things the agencies' statutory authority for issuing the GHG2 Standards. TTMA and its members, including Wabash National, are requesting that the Court of Appeals stay implementation of the

GHG2 Standards while that review takes place. I offer this affidavit in support of TTMA's request for a stay.

3. Wabash National manufactures trailers on a made-to-order basis. We are now taking orders for production in 2018. If there is no stay of the GHG2 Standards, Wabash National will have to install aerodynamic equipment on nearly all trailers that it manufactures starting on January 1, 2018. Wabash National is encountering difficulties in taking orders for the production of new trailers in 2018 because the EPA has been slow to certify some of the to-be-installed equipment that will allow our trailers to meet GHG2 Standards. Without certifications, we do not know with certainty that specific trailer orders will, in fact, comply with the GHG2 Standards. If we nevertheless commit to a customer's order and the equipment does not meet GHG2 Standards, then we will be in the position of having agreed to produce trailers that we cannot legally sell. This lack of certainty is disrupting our normal processing of orders. The GHG2 Standards do not allow sufficient exemptions for us to commit to manufacture trailer orders regardless of whether they will later comply with the standards. To avoid significant compliance risk,

potential economic losses on our 2018 orders, and potential business harm to our business reputation, we need the certainty that would be provided by a stay of the January 1, 2018 implementation date until such time that the agencies can complete their review of the standards.

4. Wabash National is also incurring substantial implementation costs that will not be recoverable if the GHG Phase 2 Rules are rescinded by the EPA and NHTSA, or if the court later agrees with TTMA that the Rules were not properly issued by the agencies. These unrecoverable costs could be delayed or avoided if the court enters a stay while the Rules are under review. These costs are:

Compliance System Development	\$300,000
Admin. Costs (including salary/benefits)	\$75,000
Incremental Wind Tunnel Testing	\$30,000
Testing Eng. Support	\$100,000
CFD Tests & Models	\$150,000
Prototypes	\$50,000
Internal Labs/Tests/Design	\$100,000
Outside Fees (consultants, attorney)	\$160,000
	<hr/>
	\$965,000

I declare under penalty of perjury under the laws of the United States that the foregoing is true and correct.

Executed in Lafayette, Indiana, on September 20, 2018.

A handwritten signature in black ink, appearing to be 'J. Scarcelli', is written over a horizontal line. The signature is stylized with large, sweeping loops.

Re: Docket ID No.s: EPA-HQ-OAR-2014-0827 & NHTSA-2014-0132

Dear Sirs,

The Truck Trailer Manufacturers Association (TTMA) is an international trade association representing approximately 90% of the truck-pulled trailers manufactured in the United States. TTMA has a history of working closely with regulators to help them understand the unique nature of the heavy-duty trailer industry and to act as a conduit between the member companies and regulators. TTMA has been working hard to help its members fully understand the proposal and draw forth a consensus comment. We present the following comment to the Proposed Rule “Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles— Phase 2” (EPA-HQ-OAR-2014-0827 & NHTSA-2014-0132).

1 - Introduction

We must first start out by observing that the proposed rule, “Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles— Phase 2” (“proposed rule” or “proposal” hereafter), is vast in scope and covers a wide range of vehicles and devices. We are directing

our comments only at proposals that relate to heavy duty trailers, without comment for or against any other parts of the proposal.

We also had asked for a longer time to pursue a more detailed evaluation of the proposal. TTMA is an organization of trailer manufacturing companies and we rely on voluntary participation of our member companies. As the agencies admit, a large proportion of these member companies are small manufacturers and as such, lack the time and resources to detail to such a long and complicated proposal. We had asked for a 90 – 180 day extension to allow those small manufacturers to adequately be brought up to speed and provide specifics to our commentary, but were granted only a 14 day extension. We will continue to pursue a dialog with the agencies past the October 1st, 2015 deadline and encourage the agencies to reach out to us as they have been doing so that we can work together to craft the best possible solutions.

2- Summary/Overview

TTMA notes that the proposal lacks legal authority, has significant safety impacts, and is overly broad and complex in light of the more functional existing voluntary systems. We will be discussing this in several sections as follows:

In our “Authority Objections” section (3), we will discuss the legal rationale the agencies are putting forward for regulating trailers, why that rationale is flawed, and that the agencies should focus their efforts on end users, which they actually do have authority to regulate.

In our “Safety Impact” section (4) we quantify some of the negative safety impacts that this proposal would entail. We strongly urge the agencies to exercise caution in this regard; both TTMA and regulating agencies have been working and continue to work diligently trying to maximize safety and this proposal sets that back.

We strongly urge the agencies to reconsider the existing voluntary program in our “SmartWay & Alternative 1” section (5). Alternative 1 works best to save fuel & GHG emissions without the numerous drawbacks found in the proposal.

We detail two different types of classification that the agencies must use in any future proposal in our “Further Areas Requiring Exclusion/Exemption” and our “Non-Aero Box Trailers” sections (6 & 7). In this way, the agencies can minimize the negative effects of the proposal.

In our “Averaging” section (8), we discuss the problems with the proposal’s averaging provisions and how what the agencies regard as beneficial to industry would actually be harmful to the trailer industry. We discourage the agencies from using this scheme in regard to trailers.

The existing proposal is overly complex and in our “Ways to Simplify/Streamline” section (9), we discuss a few ideas to modify it.

In our “Model Year” section (10), we detail the problems we have with the proposals use of model years and suggest a few fixes for future regulation.

Finally, we have a few “Miscellaneous Points” to add before we offer up our “Conclusion” in those sections (11 & 12).

3 - Authority Objections

EPA and NHTSA do not have statutory authority to adopt GHG emission and fuel efficiency standards applicable to trailers.

EPA lacks statutory authority.

Trailers themselves fail to meet the definition of a “motor vehicle” which states:

(2) The term “motor vehicle” means any self-propelled vehicle designed for transporting persons or property on a street or highway.¹

Trailers are not self-propelled, do not burn fuel or exhaust “Greenhouse Gasses.” A vehicle is defined as something used for conveyance having a frame, a suspension, and a braking system. A motorized vehicle is a vehicle (such as a car, truck, or motorcycle) that is powered by a motor. A trailer is a *vehicle* that is not motorized and therefore does not fall under the jurisdiction of the Clean Air Act.

EPA acknowledges this in its claim to authority and then attempts to dismiss it by claiming that the tractor, when combined with the trailer, together creates the motor vehicle that they are allowed to regulate under the CAA. “Connected together, a tractor and trailer constitute “a self-propelled vehicle designed for transporting . . . property on a street or highway,” and thus meets the definition of “motor vehicle” under Section 216(2) of the CAA.”²

Trucks and trailers are legally recognized by the U.S. federal and state governments as two different vehicles, each possessing its own DOT vehicle identification number (VIN), state license plate, registration, regulations, and ownership. The EPA cannot legally declare one vehicle part of the other or the two vehicles to be the same or treated as the same vehicle to enable a new regulation. If they do, then it is not the trailer manufacturer who is creating a new motor vehicle. The CAA directs the EPA Administrator to regulate “new motor vehicles.”³ The trailer is not a motor vehicle under CAA statute until it is “connected” making it possibly subject to EPA authority not at the time the trailer was constructed, but at the time an operator connects it to a tractor and completes the “Self-propelled motor vehicle” that EPA is claiming meets the definition provided under 216(2) of the CAA. At connection, the

¹ Clean Air Act, Section 216(2)

² Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium and Heavy-Duty Engines and Vehicles – ;Phase 2; Proposed Rule, 80 FR 40170 (July 13, 2015 / Proposed Rule)

³ 42 USC 7521(a)(1)

combination could then be said to meet the definition for “new motor vehicle” in 216(3) since the combination has not yet had its title transferred to the ultimate purchaser, defined in 216(5) as “the first person who in good faith purchases such new motor vehicle.”

Any given trailer is not intended to be permanently connected to any truck by the trailer OEM for the useful life of the trailer. This is the distinction that makes the trailer different from any other part or component of the truck. The truck has a device that engages the trailer’s king pin and traps it within the truck’s fifth wheel. It is a third party that engages and disengages this truck device, not the trailer, and not the trailer OEM. Specifically, trailer manufacturers do not sell new “tractor-trailers.” As such, the tractor and trailer cannot be considered a single motor vehicle (indeed, a single trailer is likely to be hauled by multiple tractors during its lifetime, and, conversely, a single tractor is likely to haul multiple trailers).

Therefore, if the Agency wants to claim, for practical reasons, that the trailer and tractor are a regulated motor vehicle, it can only regulate the party that joined the trailer to the tractor. EPA has been claiming that they cannot regulate end users of trailers, and so must aim their regulations at trailer manufactures, but this exposes EPA’s lack of authority to regulate, for these trailer manufacturers do not create the vehicles that EPA claims authority to regulate. Under the laws given in the CAA and the usual industry practice of creating new combinations of tractors and trailers to be used briefly and then separating the tractor from the trailer to create a new combination, all without transferring the titles of the combination or even of any of the individual components of the combination, it is those end users who are routinely manufacturing motor vehicles and are thus possibly subject to regulation under the laws of the CAA. It is these very end users who could and possibly should be directed to select certain trailer-based GHG-Reduction/Fuel-Economy devices based on how they ultimately use the vehicle they alone assemble.

Since a trailer is built for customer specifications and not an intended truck, trailer OEMs cannot be regulated by the EPA GHG-2 regulations. At the time of trailer manufacture, there is no defined or intended truck and the trailer is still a non-motor vehicle. Upon completion and the trailer title is passed from the trailer OEM to the trailer dealer, or end user, there is still no motorized truck that can be associated with the trailer. The trailer can be pulled by a gas, diesel, natural gas, or electric truck in the future with unknown, varying aerodynamic characteristics. When title of the trailer passes, the trailer OEM has no legal ownership of the trailer vehicle and the trailer is not a part of any truck or other motorized vehicle. The trailer at this point is a separate product yet to be put into commerce. The EPA’s definition of a trailer being a part of a motorized vehicle has not been met and the OEM no longer has a legal basis to alter the vehicle.

The language and structure of the Clean Air Act requirements and prohibitions for new motor vehicles and engines also contradict EPA’s interpretation. Those provisions contemplate a single manufacturer of each new motor vehicle or each new motor vehicle engine. For example, Section 206(a)(1) requires EPA to require testing of “any new motor vehicle . . . submitted by a manufacturer” to determine whether the vehicle may be certified as conforming to emissions regulations. Section 206(b) authorizes EPA to conduct emissions testing to determine whether new motor vehicles “manufactured by a manufacturer do in fact conform” after being certified. Section 207 requires “the manufacturer of each new motor vehicle”

to provide an emissions warranty to the ultimate purchaser to certify that the vehicle conforms to the emissions regulations and is free of defects for its useful life. And Section 203(a) prohibits “a manufacturer of new motor vehicles or new motor vehicle engines” from selling or importing such vehicles or engines unless covered by a certificate of conformity. The language of these provisions plainly contemplates a single manufacturer that is responsible for each motor vehicle, not multiple manufacturers of “two detachable parts” that together constitute the single motor vehicle, and are mixed and matched in different pairs throughout their lifetime. Moreover, these provisions on their face do not work as applied to “two detachable parts” of a single motor vehicle that are mixed and matched. In the case of separate manufacturers of the tractor and various trailers that might be hauled by that tractor, the requirements to test, certify, and warrant “the motor vehicle” cannot on their face apply as written, since there is no single manufacturer of “the motor vehicle.” And responsibility for violations, such as by selling an uncertified new motor vehicle, is unspecified.

EPA also contends that the tractor minus the engine constitutes a “motor vehicle,” even though such a chassis cannot move without the engine.⁴ We are skeptical of this assertion. We are aware of no instance in which EPA has sought to regulate a “motor vehicle” that does not contain an engine, for the obvious reason that such a “vehicle” is not self-propelled and thus does not fall within EPA’s jurisdiction. In short, Congress authorized EPA to regulate both engines and complete motor vehicles (containing engines), but did not authorize EPA to regulate a trailer, which is not self-propelled, even if that trailer might be regarded as essential to the purpose of a tractor to transport property.

Therefore, as the legal basis of the proposal from the EPA perspective is flawed, all parts of the proposal suggesting expansion of regulation of EPA to trailers should be struck. NHTSA regulation should remove requirements that, by extension, require trailer manufacturers to be regulated by EPA by directing compliance with regulations in 40CFR.

NHTSA lacks statutory authority.

NHTSA’s claim to authority relies on the Energy Independence and Security Act (EISA), which does not itself define the term “vehicle” to include trailers. To do this, NHTSA relies on the language under its organic statute, the Motor Vehicle Safety Act.⁵ It is important to note that the Safety Act’s definition is put forward “to reduce traffic accidents and deaths and injuries resulting from traffic accidents.”⁶ As we will describe below, many parts of the proposal are at odds with this mission and we urge NHTSA to carefully consider their mandate as they propose trading safety for assumed fuel savings. Here, the point is simply that NHTSA is grasping for statutory authority for the proposed rule by citing an enabling statute that has nothing to do with greenhouse gas emissions.

⁴ 80 Fed. Reg. 40,170 n.64.

⁵ 80FR4071: “Although EISA does not define the term “vehicle,” NHTSA’s authority to regulate motor vehicles under its organic statute, the Motor Vehicle Safety Act (“Safety Act”), does.”

⁶ 40USC30101 Purpose and policy

Additionally, NHTSA cites the EISA direction to create standards for commercial medium- and heavy-duty on-highway vehicles and work trucks in 49 USC 32902(k). That section includes a 24 month window for rulemaking to take place: “(2) RULEMAKING.—Not later than 24 months after completion of the study required under paragraph (1), the Secretary, in consultation with the Secretary of Energy and the Administrator of the Environmental Protection Agency, by regulation, shall determine in a rulemaking proceeding how to implement a commercial medium- and heavy-duty on-highway vehicle and work truck fuel efficiency improvement program designed to achieve the maximum feasible improvement, ...” The study referred to in paragraph (1) was to be completed within one year of the publication of a National Academy of Sciences study that was published in 2010⁷. That brings the maximum window for NHTSA to bring regulations under this law to 2013. The proposal being put forward, coming after the window set forth under law, lacks congressional authorization.

Further, NHTSA contends that the Energy Independence and Security Act (“EISA”) gives it statutory authority to regulate trailers. Specifically, NHTSA points to a provision in the EISA that directs NHTSA to “determine in a rulemaking proceeding how to implement a commercial medium- and heavy-duty on-highway vehicle and work truck fuel efficiency improvement program designed to achieve the maximum feasible improvement”⁸ The EISA defines “commercial medium- and heavy-duty on-highway vehicle” to mean “an on-highway vehicle with a gross vehicle weight rating [GVWR] of 10,000 pounds or more.”⁹ NHTSA contends that, “[b]ecause Congress did not act to exclude trailers when defining GVWRs . . . it is reasonable to interpret the provision to include them.”¹⁰

However, this definition shows just the opposite – that EISA’s definition of “commercial medium- and heavy-duty on-highway vehicle” excludes trailers. GVWR is distinct from the gross combined weight rating (“GCWR”), which includes both the weight of a loaded trailer and the weight of the tractor. EPA and NHTSA recognized this important distinction in promulgating GHG Phase One emission standards and fuel efficiency standards for medium- and heavy-duty engines and vehicles in 2011, stating: “GVWR describes the maximum load that can be carried by a vehicle, including the weight of the vehicle itself. Heavy-duty vehicles also have a gross combined weight rating (GCWR), which describes the maximum load that the vehicle can haul, including the weight of a loaded trailer *and the vehicle itself*.” (emphasis added)¹¹. In other words, the trailer is not included in the definition of “commercial medium-and-heavy-duty on highway vehicle” as previously interpreted by NHTSA, since that definition refers only to a tractor’s GVWR and does not refer to a combination tractor and trailer GCWR. It is therefore reasonable (and it is consistent with the agencies’ previous interpretation) to *exclude* trailers when interpreting 40 U.S.C. § 32902(k)(2).

⁷ <http://www.nap.edu/catalog/12845/technologies-and-approaches-to-reducing-the-fuel-consumption-of-medium-and-heavy-duty-vehicles>

⁸ 49 U.S.C. § 32902(k)(2).

⁹ Id. at § 32901(a)(7).

¹⁰ See 80 Fed. Reg. at 40,171.

¹¹ See 76 Fed. Reg. 57,106, 57,114 (Sept. 15, 2011)

We understand that the agencies may take issue with our claims as to the way the law interacts with the truck trailer industry and the agencies' proposal, so we will address further comments at both EPA and NHTSA parts of the proposal. This is intended to instruct both agencies as to ways that the proposal could be improved with regard to the truck trailer industry without condoning the agencies' proposed expansion without legal authority.

4 - Safety Impact

TTMA is highly concerned with creating and maintaining a safe environment on and off the nation's roadways when it comes to the use of truck trailers. The current voluntary model of Federal GHG & fuel conservation relies on payback to incentivize end users to adopt technologies like aerodynamic features. Such a payback-based feature causes users to avoid the technology in end-use situations where either speeds or loads preclude payback; e.g. if a user needs to leave a pallet off their trailer because the aero devices put them over the weight limit, they will choose not to use them. The proposed rule will, of necessity, force aero devices on end users who otherwise would be avoiding them. For low speed users, this is simply a waste of resources¹², but for users operating at or near weigh-out conditions, the weight of the aero devices forces more trips as freight has to be hauled on a second load. Those extra trips pose a safety risk which must be accounted for.

Estimate of Safety Impact of Deadweight Load of Aerodynamic Devices

Using a 250 lb. weight of aerodynamic devices per trailer, and a cargo load of 50,000 lb. when tractor-trailer is in Weigh-out mode means that the 250 lb. for extra devices will have to be hauled on an additional trip.

$$\frac{250 \text{ lb add'l}}{50,000 \text{ lb cargo per Weigh-out Trip}} = 0.5\% \text{ increase in Weigh-out Trips}$$

Approximately 30% of tractor-trailers are operating at or near weigh-out conditions.¹³

$$0.5\% \text{ increase in Weigh-out Trips} \times 30\% \text{ VMT in Weigh-out Conditions} \\ = 0.15\% \text{ increase in Vehicle Miles Traveled (VMT)}$$

Annual VMT for tractor-trailers is 122,705 M VMT/year.¹⁴

$$0.15\% \text{ Increase in VMT} \times 122,705 \frac{\text{M VMT}}{\text{year}} = \text{increase of } 184 \text{ M VMT/Year}$$

¹² Draft RIA, p2-155 "It can also be seen that very little benefit is seen for tractor trailers driving under highly transient conditions."

¹³ "...weigh-in-motion data for 3-S2s indicate that over 70 percent operate at 70,000 pounds gross vehicle weight or less." (Comprehensive Truck Size and Weight Limits Study, November 2013, Modal Shift Analysis, p8.)

http://www.ops.fhwa.dot.gov/freight/sw/map21tswstudy/deskscan/modal_shift_dksn.pdf

¹⁴ Base Case for VMT total: 122,705,589,552. Ibid. Table 1, p12.

Collision rate for Tractor-trailers is 134/100 M VMT.¹⁵

$$\text{Increase of } 184 \frac{\text{M VMT}}{\text{Yr}} \times \frac{134 \text{ Collisions}}{100 \text{ M VMT}} = \text{Increase of } 246 \text{ collisions/year}$$

Approximately 3% of Tractor-trailer Collisions involve fatalities.¹⁶

$$\text{Increase of } 246 \frac{\text{Collisions}}{\text{year}} \times 3\% \frac{\text{Fatality Involvement}}{\text{Collision}} \approx 7 \text{ extra fatal accidents per year}$$

In general, the safety impact of additional weight on trailers is 1 extra collision per year for every pound of added trailer weight, and one additional fatality-involved crash per year for every 35 pounds additional trailer weight.

Note that since the proposal relies heavily on EPA methodology that favors “technology-forcing” regulation, where regulations are formulated to require devices that do not currently exist, the proposal goes beyond NHTSA’s mandate to reduce deaths, injuries and economic losses resulting from motor vehicle crashes. Some of these devices don’t yet exist in a form that would satisfy the proposal, and those that do have potential safety risks that have not been fully explored.

5 - SmartWay & Alternative 1

For the purposes of trailer manufacture and end use, the EPA’s SmartWay program coupled with voluntary adoption bring the optimal solution to reducing greenhouse gas emissions and fuel consumption in the heavy duty freight sector.

Unlike the private car market, heavy duty trailers are used almost exclusively in a very competitive commercial market where fuel costs are second only to labor costs. As such, there is a huge financial incentive for end users to reduce the amount of fuel consumed and incidentally reduce greenhouse gas emissions released during operations. Innovators have been coming up with devices, methods and strategies to accomplish this for decades. These innovations often had varying degrees of actual effect compared to the claimed effect as each innovator would tout their product only in its best light. To complicate matters, not every innovation would be appropriate for every end user’s operation. This double level of confusion created a barrier to new products coming into use.

SmartWay, when it came on the scene, removed one side of the confusion. By setting a standard to test products against, it allowed end users to remove one layer of variables to be evaluated before selecting a new approach to control fuel consumption. End users could now consider how well their operations

¹⁵ “The rate for tractor-semitrailers was 42/100 million VKT (134/100 million vmt)” (Comprehensive Truck Size and Weight Limits Study, November 2013, Highway Safety and Truck Crash Comparative Analysis, p16.)
http://www.ops.fhwa.dot.gov/freight/sw/map21tswstudy/desksan/safety_dksn.pdf

¹⁶ “For example, in Idaho, about 3% of crash involvements for each involved a fatality, about 30-33% included an injury, and the remainder involved only property damage (PDO).” Ibid. p17.

would respond to SmartWay verified technologies when making their decisions. In doing so, the adoption of workable fuel savings technologies in areas where they will actually perform was accelerated.

SmartWay is not perfect. For example, it lacks ability to account for possible savings from tire inflation control strategies, and it's still limited in the types of trailers it considers, only recently expanding into refrigerated trailers. However, a voluntary program manages to get the maximum feasible improvement in fuel economy and greenhouse gas emission reduction without the unintended side effects of inappropriately pushing strategies into areas where they do not have an actual gain.

We urge all parties concerned with creating an actual reduction in fuel consumption and greenhouse gas emissions to adopt Alternative 1 with respect to trailers. If the agencies feel the need to regulate, they should direct their regulations at end users who are selecting particular trailers to use with particular tractors for a given cargo and route. While California's blanket requirement for trailers to be SmartWay certified was poorly thought out as to which end users might actually see benefit and which wouldn't and had a host of unintended effects as a result, it was at least aimed at the correct market to effect change.

We also note that in the current environment outside of California, end users that could benefit from SmartWay verified aero technologies are already using it. The proposal's cost benefit analysis seems to overlook this important factor. As such, it both undervalues the work that has been done, by failing to note that aero-device adoption is disproportionately adopted in long haul operations and overvalues the proposal by assuming that new devices fitted to trailers that currently don't have them would be used at fleet-average speeds, when that group of trailers are actually running at below average speeds.

As we will describe below, any steps to pursue the agencies' goals of improving fuel economy and reducing greenhouse gas emissions must carefully consider areas to exclude and/or exempt from regulation to avoid unintended effects.

6 - Further Areas Requiring Exclusion/Exemption

The proposal asks for input on the merits of exclusion versus exemption of various trailer types.¹⁷ Our objections to the agencies' authority notwithstanding, we feel that all regulations should be crafted in such a way as to minimize unnecessary negative impact on manufacturers. Tracking and reporting burdens are very real costs, and should only be used by the agencies when there is a definite social gain to be had. There is no gain to be had by requiring reporting and tracking for classes of trailers that are not the subject of this proposal, so we encourage the agencies to maximize the use of exclusions wherever practicable.

¹⁷ 80 FR 40259: "We seek comments on whether, in lieu of the exclusion of trailers from the program, the agencies should instead exempt these trailers from the standards, but still require reporting to the agencies in order to verify that a manufacturer qualifies for an exemption."

TTMA recognizes that the agencies have made great strides in gaining an understanding of the trailer industry and have laid forth certain types of trailers which should be excluded from the proposal.¹⁸ There are certain problems with the classification of some trailers and other types that also ought to be excluded.

Heavy Haul Exclusion

The proposal intended to exclude trailers designed for heavy-haul applications, but apparently used a simplistic combination of length and axle count to define a heavy-haul trailer. While such a metric is a useful test, it omits several other design characteristics that define certain heavy-haul trailers that otherwise would not pass the proposal's "Trailers shorter than 35 feet in length with three axles, and all trailers with four or more axles (including any lift axles)."

Heavy-haul style trailers are designed to carry equipment used for construction, agricultural, mining, logging, power generation and other industries, specialized loads generally not transported on a regular basis, high center of gravity loads, and over-sized (length, width, height, and/or weight) loads. Most of these trailers operate in either very small fleets (two to three trailers) or are owner-operated where requirements for specific tire and equipment types would cause a larger financial burden than the perceived benefit of reduced fuel use.

The following recommendations for exclusion are based on specific physical characteristics that are designed into each trailer type in order for it to perform its intended function. These trailers are not intended for nor are they used for over-the-highway long haul operations or at highway speeds for extended periods of time. These trailers will operate both on and off road, at various speeds, and in various terrains. There are not specific design characteristics that indicate that this trailer should operate at low speeds or on a specific type of terrain, but, these are physical characteristics that can distinguish heavy-haul style trailers from other trailer types.

"Jeep; Dolly, Load Divider"

As defined in 49 CFR 571.121 S4, a load divider dolly means a trailer composed of a trailer chassis and one or more axles, with no solid bed, body, or container attached, and which is designed exclusively to support a portion of the load on a trailer or truck excluded from all the requirements of this standard.

"Heavy Haul"

Any trailer that has a gross vehicle weight rating (GVWR) of more than 120,000 pounds or any trailer equipped with an axle that has a gross axle weight rating (GAWR) of 29,000 pounds or more.

"Expandable"

As defined in 49 CFR 571.121 S3.(a), any trailer that has a width of more than 102.36 inches with extendable equipment in the fully retracted position and is equipped with two short track axles in a line across the width of the trailer.

"Extendable"

Any trailer that has air lines designed to allow extension of the vehicle frame or load deck.

¹⁸ 80 FR 40259: "(5) Exclusions and Less-Stringent Standards"

“Modular”

Any trailer that has air lines designed to allow separation and removal of deck sections or insertion of deck sections to create longer or shorter load carrying areas.

“Sliding”

Any trailer that has an undercarriage system designed to move forward or back to allow the load deck to tilt, slide, or adjust into a position that facilitates the loading or unloading of equipment but must return to original position for transport.

“Multi-Axle”

Any trailer that has two or more permanently attached axles (including lift axles) and designed to accept additional removable axles, flip axles, and/or load transferring boosters; both mechanical, hydraulic, or air (or other gas).

Dump Trailer Exclusion:

There are a variety of trailer designs that nominally appear to be simple box trailers, but due to the design being used for in-field operations and short haul/low speed operations almost exclusively, should be excluded from the proposal.

“Dump trailer”

An open-topped trailer having a load-bearing container body structure with a hydraulic cylinder that allows the container to be tilted to discharge its contents through an open tailgate or equipped with special doors/gates to allow discharge of contents by gravity that is used in short-haul transport of construction, paving, demolition and other bulk materials such as sand, gravel, asphalt, sludge, scrap metal, farm products etcetera from off-road mine/pit loading sites to off-road construction unloading sites.

“Refuse transfer trailer”

A usually open-topped trailer having a load-bearing container body structure that can be tilted on an external hydraulic tipping platform or equipped with a self-unloading floor to discharge its contents through an open tailgate that is used in short-haul transport of refuse material (garbage) from off-road transfer station loading sites to off-road landfill unloading sites.

ATIS Exemption:

Certain tires/loads have working pressures in excess of what tractors can provide. These trailers should be exempt from the ATIS requirement.

Lift Gate Equipped Trailers:

Rail Lift & Lift Gate equipped trailers operate at low speeds and perform local deliveries. As such, they ought to be classified as “non-aero” based solely on the inclusion of a lift, however a better approach non-aero trailer classification will be discussed below.

7 - Non-Aero Box Trailers

TTMA recognizes that the agencies have tried to account for the variety of trailer designs and the various sorts of service they are put in by creating a “non-aero box” category of trailer that is defined by the deployment of certain equipment or design features similar to our call for a “work performing equipment” exclusion in our October 16, 2014 letter.¹⁹ Unfortunately, the way that the proposal crafts this, it fails to capture the full extent of trailers that are operated at low speeds and for short trips.

Consulting Figure 1-5 from the draft RIA²⁰ a significant fraction of the trailers are used on short trips and are therefore predominantly operated according to what the Agencies term “transiently.”

As written, the proposal neglects the fuel costs and greenhouse gas emissions associated outside of operations on the trailer. The

rule needs to account for the GHG and energy consumption of various devices during the entire lifetime of the component; construction, delivery, use and disposal, rather than just highway use as they do now. Although not required by statute, it would be foolish to require the use of devices whose GHG savings in use are small compared to the GHG emissions used during production, delivery, disposal, and necessary uses outside of running down the highway such as maintenance, retreading, etc.

For aero-devices, estimating the carbon footprint of manufacture, distribution, service and disposal is difficult. One approach is to use a simplified cost of goods calculation based on the carbon footprint of the general automobile industry. This gives a rate of 460 kgCO₂/\$1,000²¹. Therefore, for a van trailer operated in a transient mode but still required to have \$900 of aero-devices fitted, there will be a CO₂ penalty of \$900*(460/\$1000) = 414 kg CO₂ over the useful life of the aero-device. Additionally, this

¹⁹ EPA-HQ-OAR-2014-0827-0146

²⁰ EPA-HQ-OAR-2014-0827-0243

²¹ *How Bad Are Bananas? The Carbon Footprint of Everything*: puts the carbon emission of automobile manufacture at 720 kgCO₂/£1,000. Converting to dollars gets the quoted figure.

device will need to be hauled itself, its 250lb or 1/8th ton, would lend an additional 11g per mile (baseline emissions of 85 per ton mile times .125 ton, this would be higher on short trailers with their higher baseline). This in addition to the .15% decrease in performance from the effect of displaced cargo when operating at or near weigh-out conditions as described under “Safety Impact.”

For these transiently operated trailers, what benefit is available would come from LRR Tires and ATIS. As described above, applying aero treatments to these trailers will result in an increase of GHG emissions/fuel consumption relative to an untreated trailer with LRR tires and ATIS rather than the desired reduction. The appropriate solution here is to recognize that trailers operated in transient service are more appropriately categorized as “non-aero box trailers”. The agencies can and should recognize some fraction of the annual tractor-trailer combinations of each category as non-aero. End users eager to reap the rewards of aero-treatment payback, if it is realistic for their uses, can be counted on to select the correct type for their particular trip use.

While we recognize the steps the proposal made to define a non-aero box trailer by certain devices fitted to it, by focusing solely on these items rather than on usage, you could create a situation where the market drives increased adoption of features to move trailers intended to be used transiently into the non-aero box category despite those devices not otherwise being needed to complete the job. An unneeded rear lift gate or side-mounted pull-out platform would have all the negative consequences of an unneeded skirt in terms of weight impact creating both a safety hazard and increased emissions described above. By allowing a fraction of tractor-trailer combinations with applicable trailers (Long vs Short/Dry vs Refrigerated) to be designated as “non-aero,” you eliminate these perversities that would arise between the proposed regulation and market forces and instead allow regulators and industry to focus on maximizing improvement. By removing the fraction of trailers that are used transiently, the standards that are set for the remaining trailers could possibly be raised from the proposed values and on a faster timetable. But this would *only* be possible with reasonable levels of non-aero box van classification.

8 - Averaging

While we understand that the agencies view Averaging, Banking and Trading programs as beneficial to the regulated industry, it’s important to realize that the trailer industry is not the automobile industry. The six year annual production average for trailers is 187,666 while for cars, it is 13,906,666. It would take the trailer industry 74 years to build what the automobile industry builds in a single year.

Averaging will cause unnecessary disruption in the trailer industry. Currently, most trailers are built to customer specification and most customers have found a preferred manufacturer to build to that specification. With averaging, a given manufacturer may find that the mix of customers in a given year does not allow them to meet their target, which would require that manufacturer to turn away customers and force customers to seek new vendors for established trailers. Manufacturers who specialize in making trailers that are typically used transiently, such as trailers used for intra-city distribution, would be particularly hard hit; the trailer they specialize in would have little to no real-world gains in efficiency while it would have many real-world penalties. Customers would be quick to recognize this and when the specialist manufacturers had to stop selling optimal trailers to meet the averages in the proposal, the customers would have to seek out a new trailer supplier. Large manufacturers aren’t

looking forward to this either, as a flood of new customers looking for these trailers would skew their numbers and create problems for the larger customers they focus on.

Rather than do this, we would prefer that averaging be done away with entirely: each trailer subject to regulation should be required to meet a given standard. This will require that certain users will have to change their specifications, but will cause minimal disruption to the industry. To do this with minimal disruption to the greater freight industry, careful thought will be needed to be given to trailers that are excluded as mentioned above. The best option would be to allow market forces to work on the situation with the voluntary SmartWay program.

More importantly, however, we request that the agencies demonstrate the commercial feasibility of the proposed rules before they can take effect –i.e., that EPA and NHTSA provide reliable evidence that the technologies imposed by the proposed regulations can be successfully marketed to motor carriers, given that these technologies already exist as options but are not being widely purchased by many motor carriers because their mix of drop-and-hook operations and multiple short, low-speed deliveries does not generate measurable fuel savings benefits. The proposed rules do not require *motor carriers* to purchase specific equipment or to attain specific fuel efficiency goals. Instead, the proposed rules will *require trailer manufacturers to sell* this equipment to an increasing majority of their customers whether these customers want it or not. More accurately, the proposed rules will require the larger manufacturers to sell this equipment, while exempting smaller manufacturers from that requirement at the outset, an exemption that will certainly divert sales to the smaller trailer manufacturers in early years and thereby fail to achieve the agencies’ desired goals while arbitrarily and unreasonably imposing the sales obligation on the larger manufacturers. As noted above, however, the reality is that all trailer manufacturers are small manufacturers when compared to the manufacturers of the millions of other motor vehicles sold in the United States annually, which, because of those huge volumes, have the ability to sell expensive and highly fuel efficient vehicles at little or no profit in order to offset sales of more popular less fuel efficient vehicles. Trailer manufacturers, by contrast, do not have the sales volumes needed to absorb trailer sales that produce little or no profit, which will certainly be the effect of requiring them to install equipment that their customers have so far refused to purchase and which those customers will simply refuse to pay for if the new rules take effect. The EPA and NHTSA have produced no reliable, measurable evidence that those motor carriers can be forced to pay for the required technologies, and instead the agencies are proposing to put (some) trailer manufacturers in the completely unreasonable position of insisting that their customers pay for equipment that is not wanted or accept delivery of unwanted equipment at the trailer manufacturer’s expense. In the latter instance, the cost of the proposed regulations, which are purportedly justified achieve a national benefit, will be arbitrarily and unreasonably (and in many cases impossibly) imposed solely on (some) trailer manufacturers and not passed on to the motor carriers and then on to their customers, the shippers and the public at large. Therefore, for the proposed rules to satisfy the legal requirements that they be reasonably drawn and achievable in fact, their commercial feasibility must be proven and not merely assumed, and the proposed rules must not establish unreasonable and arbitrary distinctions and sales requirements that disproportionately burden a minority of market participants. Alternatively, the legal requirements to purchase and install the desired equipment should be imposed on the motor carriers directly so that the free market for trailer sales will not be arbitrarily segmented and defeated.

9 - Ways to simplify/streamline

When and if legal authority is given to regulate trailers, there are certain ways that the program could be streamlined. One example would be to require trailer tires to be low rolling resistance and/or trailers to have ATIS as part of NHTSA only, so that compliance can be within the manufacturer’s certification label to remove unneeded

compliance burden. That way, the regulated classes of trailers goes down and the EPA can focus its priorities where they will do the most good, while manufacturers of non-aero- and non-box-trailers will have a minimum of compliance burden while maximizing the available CO₂ reductions/fuel savings.

Moreover, there are far more effective methods to reduce fuel consumption and improve the freight sectors carbon footprint. Recent proposals to lengthen combination trailers to 33' would have a tremendous impact. This can be seen in the agencies own data and proposed CO₂ standards for trailers, where longer trailers have substantially lower CO₂ emissions per ton-mile²². Similarly, an increase in permissible weights would be met with improvements in fuel economy and carbon footprint. Also, a slight reduction in speed limits for HD vehicles would be most effective²³. Any and all of these would have to be done carefully so as to give due consideration to all aspects including safety concerns, but they would work better than the proposal as written.

Regardless of exemption levels and classification schemes, requiring reporting on every individual trailer produced and each device fitted as the proposal envisions is overly capricious, unreasonably burdensome and is not supportive of the goal of reducing greenhouse gas emissions or saving fuel. Individual trailer manufacturers can certify that they have complied with the regulations and that should be sufficient. If the agencies elect to regulate end users as we suggested in our authority objections sections, we could see adding a panel/label that clearly spells out the characteristics of the trailer in terms that work with that regulation.

10 - Model Year

The proposal's definition of Model Year (see p 40663) differs from NHTSA's²⁴ and penalizes manufacturers who are making trailers with forward reaching model years for sales purposes. EPA staffers have verbally assured us that the model year as required under this rule does not need to be the same model year used for sales purposes. We will be in position of potentially selling trailers marketed and marked on the VIN plate as Model Year 2019, while marking on the EPA plate "THIS VEHICLE COMPLIES WITH U.S. EPA REGULATIONS FOR 2018 HEAVY-DUTY VEHICLES." Any proposed definition of Model Year should explicitly state this. For example, §1037.801 could be expanded to include a new paragraph:

* * *

(3) The model year as used in this part need not correspond with the model year used for VIN and marketing purposes.

* * *

while the same paragraph should be added to §535.4's definition of MODEL YEAR.

²² E.g. 80FR40612 Table 1 of §1037.107 – Phase 2 CO₂ Standards for Trailers.

²³ For Long Dry Vans, the proposal goes from a baseline of 87.6 to 77 g/ton-mile of CO₂ or a 12% reduction. Fuel required roughly scales with the cube of speed, so a reduction of 4% to speed limits, or reducing 65 to 62 would do that.

²⁴ 49CFR565.12(m) – "Model year means the year used to designate a discrete vehicle model, irrespective of the calendar year in which the vehicle was actually produced, provided that the production period does not exceed 24 months."

Additionally, modify the labeling requirements in 1037.135(8) to read:

(8) State: “THIS VEHICLE COMPLIES WITH U.S. EPA REGULATIONS FOR [MODEL YEAR] HEAVY-DUTY VEHICLES.” Optionally, the word “MANUFACTURED” may be added after the model year.

This will make it clear that if a trailer manufacturer adopts a calendar year model year for this rule, it can continue its practice of using an advance model year for VIN and marketing purposes and to avoid confusion, the Emission Control Label on a vehicle with a 2019 Model Year on the VIN plate manufactured in 2018 could read “THIS VEHICLE COMPLIES WITH U.S. EPA REGULATIONS FOR 2018 MANUFACTURED HEAVY-DUTY VEHICLES”. If authority comes through NHTSA, a similar label requirement could be used in §535.

11 - Miscellaneous Points:

Automatic Tire Inflation Systems:

The definition of ATIS describes a system that does not exist. “Automatic tire inflation system means a system installed on a vehicle to keep each tire inflated to within 10 percent of the target value with no operator input.” State of the art systems only add air to underinflated tires. While overinflated tires do not have a detriment in terms of rolling resistance, they do have problems with accelerated tread wear.²⁵ As stated earlier, this proposal overlooks the full carbon footprint of the things it’s proposing to regulate. For tires, CO₂ emitted outside of use is 16% of the amount emitted during use.²⁶ An ATIS system is slated to give a 1.5% reduction in emissions, but if that results in a substantial reduction in tread life, the relative fraction of emissions will balloon to eclipse the savings.

Requirements of Tire & Component Manufacturers:

On page 40278 and in footnote 246, the rule mentions that EPA is considering adopting regulatory text addressing obligations for tire manufacturers. Specifically, the EPA asks that, in the event they discover tires on certified trailers that do not conform to the regulations, that they require the tire manufacturer to recall and replace the nonconforming tires. TTMA supports this concept and suggests that when and if regulatory authority is granted, if possible, it be extended in two specific ways. First, that the recall and replace provisions not be limited to tire manufacturers, but to all suppliers of regulated trailer components including Automatic Tire Inflation Systems and Aerodynamic Components. As EPA alludes to in footnote 246, the industry would be uniquely challenged by recall and replace provisions if a tire manufacturer is found to be out of compliance, but the same situation would apply if an aerodynamic skirt were also found to be out of compliance. Second, if the agency insists on collecting data for every trailer made, that the agency tracks the relevant performance figures from component manufacturers (C_{RR} for tires, Delta C_{DA} for aero-devices) and allows the manufacturers to select the actual component they fitted when filing with the Agency so that it will auto populate with the correct figure. This would have two major advantages.

²⁵ *TIRE PRESSURE MONITORING AND INFLATION MAINTENANCE* Developed by the Technology & Maintenance Council’s (TMC) S.2 Tire & Wheel Study Group; Study Group Information Report: 2010-2. “...10 percent overinflation will reduce tread wear by five percent. ... Overinflated tires are more vulnerable to tread surface cutting, impact breaks, punctures, and shock damage which also shortens tire life.”

²⁶ <http://www.bridgestone.com/responsibilities/environment/mission/emissions.html> Total Lifecycle CO₂ emissions for a tire are 86.4% during use.

First it would prevent transcription errors as manufacturers filed with the agency. Second, it would provide the Agency with a database of trailers that may have been fitted with a given tire or aero-device in the event that they determine that a recall is required. Provision would still be needed for trailer manufacturers to enter their own data in the event they are using components of their own manufacture or their own testing of particular device combinations as the Agency is encouraging²⁷.

Weight:

As described in our Safety Impact section, increased tare weight contributes to increased VMT. While the safety concerns associated with this are our first concern, we ought to consider the fuel consumption and GHG emission effects of these extra trips. This will serve to reduce benefit from applied devices. Similarly, light-weighting trailers will allow more cargo to be carried and thus result in a reduction in VMT and a corresponding reduction in Fuel consumption and GHG emissions. Based on our reading of the EPA documents, the factors applied to weight reduction strategies do not include this effect and most certainly should.

Warranty Problems:

The proposal requires that all devices added to trailers be warranted for a period of five years, one year for tires. Such a warranty would be required “to warrant that these components and systems are designed to remain functional for the warranty period.”²⁸ This has a few significant problems. For tires, some users will wear through their tires in less than a year’s period. With the overinflation problems expected with the widespread adoption of ATIS, we would expect that number to grow. Tire wear must not be covered under any warranty. Speaking of ATIS, the useful life for these systems is on the order of 5 years alone and we are not aware of any system that has a baseline warranty of more than 3 years. The proposed warranty period for ATIS needs to be reduced. Further, the most common problem with aero-devices is with collisions with infrastructure and other road hazards. Any warranty requirement must also exempt collisions and other non-routine use.

Unintended consequence: brake/wheel end warming:

Over the history of design of a wheel end for usage on trailers, a continued goal has been to provide for the safest, longest lasting, and cost sensitive components possible. The industry continues to reconfigure the brake drum toward these ends. Consequently the weight of a brake drum has been reduced approximately 18% over the past 30+ years (resulting in reduced fuel consumption and therefore reduce CO2 creation). The proposal may reverse this design due to the need to dissipate heat. The heat is created due to braking action, which up until now was cooled via air flow. The concern with the proposal is that, with added side skirts and wheel deflectors for aero purposes, the air flow across the drum area is minimized resulting in an allowance of temperature increase. One way to manage the temperature would be to add mass to the brake drum, resulting in additional weight, thus conflicting with the intended potential advantages of fuel conservation. If temperature is allowed to build it will affect bearings, lubricant, seals, brake lining, heat treatment of drum.....in extreme conditions the tire bead could break seal from the rim or the tire could actually ignite and burn the unit to the ground.

²⁷ P40280: “In addition, the agencies believe that discounting the delta CDA values of individually-tested devices used as a combination would provide a modest incentive for trailer or device manufacturers to test and get EPA preapproval of the combination as an aerodynamic system for compliance.”

²⁸ 80FR40282

The Problem with Technology Forcing and Long-Duration Regulations:

This proposed regulation postulates an aggressive schedule of technological development for a long period into the future. While we appreciate the experience the agencies have brought forward in making these predictions, and that the regulation is crafted with the intent of bringing a certain degree of stability to regulation by laying out a roadmap until MY 2027, facts often fly contrary to the best predictions. Moreover, other voices are calling on the agencies to pursue a more aggressive schedule, one that would require an even faster technological development and deployment schedule. Therefore, we request that the regulation have built into it a mid-course review. For areas where there have been unexpected delays, say due to intellectual property rules creating a monopoly for a critical item such as a trailer boat-tail, then this could be addressed. If the rule posited the boat tails would be developed for trailers equipped with roll-up doors despite that no such devices exist today, only to find out that the technical challenges of creating a viable device precluded one, the rule could be revisited. Similarly, if a new device came along that offered improvements beyond what the Agencies envisioned, then the rule's goals could be pushed forward to include that.

DOE Super Truck Program

In the DOE Super Truck Program, a truck and trailer were paired together and optimized together as a pair for aerodynamic performance. At the end of this optimization, neither the trailer nor the tractor could be said to be interchangeable with other trucks or trailers. There are truck aerodynamic design specifications or characteristics that can counteract and negate the trailer aerodynamic device fuel savings. The trailer OEM should not be regulated to add aero devices to trailers because the truck, trucks, or variety of trucks, to be used to tow the trailer is not known and such an understanding of the effects of truck aero design and how it affects the aerodynamic characteristics of the trailer is mostly not well understood nor have been shown to be constant or changing over time.

Costing

Anti-Trust issues prevent us from gathering cost of goods data. Our members have commented that the costs of certain components in the RIA seem quite low.²⁹ We will encourage members to submit specific examples directly to the agencies as confidential business information.

12 - Conclusion

The legal basis for including trailers in this rulemaking is flawed and as such it should remove trailers from consideration. If the agencies are set on working to reduce greenhouse gas emissions and fuel consumption as a result of trailer use, they would be better served by regulating that use directly. Drivers and fleets are the ones in control of trailer use, from specification thru disposal; they create new tractor-trailer combinations every day and are the ones who purchase fuel and emit greenhouse gas as a result.

²⁹ As pointed out in the text, member companies cannot share specifics through the Truck Trailer Manufacturers Association. We will be encouraging individual members to cite this footnote and supply supporting materials as confidential business information.

Outside of regulating direct use, the agencies should continue voluntary implementation of technological advances. The trucking transportation industry has been and still is very interested in all aspects of fuel-saving technology, and has, through programs such as SmartWay, made great strides in fuel conservation. The driving force behind such implementations has been the financial bottom line of the motor carriers. Some of the innovations employed include increases to interior volume while maintaining exterior size, reduction in weight, decking systems for multi-layer cargo transportation; along with some of the technologies the EPA regulation is basing its reductions on, such as aerodynamic devices, low rolling resistance tires, and automatic tire inflation systems. These advances have been employed as the industry has seen and realized value supported by evidence. The current proposal for a regulation will indeed claim a difference which would likely have been accomplished through the voluntary adoption of systems proven as functional. An unintended side-effect will be the increased creation of CO₂ due to the additional fuel expended on those “regulated units” that do not operate in a manner which causes the added options to provide for a realized and effective performance.

When push comes to shove, the motor carrier industry is very resourceful and may take action which actually detracts from the overall purpose of reducing CO₂ creation. One such scenario has been experienced in the CARB trailer regulations in the state of California; many shipments have found their way to container/chassis combinations as an over-the-road mode of transportation which will not be required under the current proposal to be equipped with any of the aerodynamic features that trailer manufacturers will have to install on trailers. Cargo containers are also, by common design, inherently less aerodynamic given their ribbed sides and square edges. The combined weight effect of this diversion is a 5,000 lb. increase per container-chassis shipment to the empty weight of the unit of transference. Thus the proposed regulations will create an arbitrary and unreasonable outcome by diverting substantial cargo on a nationwide basis to far less efficient container chassis modes of transportation, and this will significantly undermine the desired goals of the proposal. Container and chassis manufacturers will be unreasonably favored in the marketplace by exclusion from the regulations, while their unregulated products will continue to produce less efficient aerodynamic outcomes than trailers currently in production today.

If rules must be crafted, they should be done so reasonably, and not arbitrarily, so as to avoid these sorts of deleterious effects. We have pointed out certain areas that the agencies have overlooked for both exclusion from the rule and for changing the ways that box trailers are counted to account for the ways that they are used. We also encourage regulators to refrain from unnecessarily harming the trailer manufacturing industry by being sensitive to its small-business, produce-to-order nature and to craft any such regulation with the realization that there is no “average” trailer manufacturer. Putting a manufacturer out of business by forcing it to make what it cannot sell or exclusively absorb costs that it cannot pass on will save no fuel and reduces no emissions. There are methods in use today that accomplish regulation of the industry without such an arbitrarily heavy hand as the agencies are proposing here. We have detailed a few such ways that the agencies should consider that would reduce the unreasonable burden while still accomplishing the agencies goals.

Once again, we appreciate the agencies' outreach to us and pledge to continue dialog to help the agencies craft the best regulations possible. We will continue to gather data and may submit further information as it becomes available, and welcome inquiries from the agencies.

Sincerely,

John Freiler

Heavy-Duty Engines and Vehicles — Phase 2
EPA-HQ-OAR-2014-0827; NHTSA-2014-0132; FRL-9933-57-OAR**

In its 100 years of building trailers in the United States, Utility Trailer Manufacturing Company has grown to be North America's largest producer of refrigerated semi-trailers and the third-largest producer of semi-trailers by volume. Along with its persistent commitment to building the industry's strongest, lightest, and safest trailers, Utility is an excellent steward of the environment. Utility Trailer therefore appreciates the Agencies' overall goal of reducing greenhouse gas emissions.

Unfortunately, by extending its Proposed Rule to semi-trailers, the EPA has adopted an unprecedented interpretation of its authority that exceeds its Congressional authorization. Additionally, the Agencies have based its analysis on assumptions that are completely untethered from the real world, resulting in proposed regulations that will yield minimal, if any, net greenhouse-gas reduction while imposing crippling administrative burdens on the semi-trailer industry. Utility Trailer respectfully requests that the Agencies reconsider the wisdom of pursuing its foray into regulating the aerodynamic performance of trailers, and – if they nonetheless are committed to this path – to reform their rules to minimize unnecessary burdens on the industry.

Utility Trailer is a member of the Truck Trailer Manufacturers Association ["TTMA"], which itself has submitted its own detailed comments concerning the Proposed Rule. Utility Trailer supports with minimal exceptions the positions

advanced by the TTMA. In an effort to avoid duplication, Utility Trailer has avoided repeating TTMA's positions in these comments.

1. MARKET FORCES WILL ACHIEVE MOST OF THE BENEFITS OF THE PROPOSED RULES WITH FEW OF THE COSTS

The semi-trailer industry is a mature, extremely competitive, cyclical, low-margin industry. Utility Trailer and the other large manufacturers do not dictate specifications to their customers. Rather, their customers are often large trucking fleets who design their trailers to meet specific needs and then seek to have the manufacturers produce them on a semi-custom basis. The customers are overwhelmingly interested in a trailer that meets their respective specific needs in the most cost-effective way, as the transportation industry too is a mature, low-margin industry.

What this means is that if technological advances exist that will permit the transporters to move their goods more efficiently at lower costs, they will require the manufacturers to supply those advances. The Agencies justify the Proposed Rules by touting its cost-benefit payback to the trailer owner, claiming that there is a two-year payback on the mandated technologies.¹ As mentioned later, Utility Trailer believes the Agencies have understated substantially the cost of the mandated technologies. But accepting as accurate for now the Agencies' estimates on which it based its Proposed Rules, the owners have every incentive to require that their trailers have these technologies in place and to buy them.

What possible justification is there for the Agencies to substitute their judgment and mandate for free-market forces, which operate very efficiently in the trailer industry? The Proposed Rule does not provide any; it does not explain why the operators, left to their own devices and the free-market, would not adopt these technologies.

One justification, of course, is that the technologies simply don't provide the savings touted by the Agencies in all applications. As discussed later, all real efficiencies from the aerodynamic devices (trailer skirts, trailer tails, and similar devices) mandated by the Agencies come at higher speeds – not a surprising conclusion since elementary physics tells us that aerodynamic drag is proportional to velocity squared, and power (and thus fuel) required to overcome this drag force is

¹ "We project that the average cost per trailer to meet the proposed MY 2027 standards for these trailers would be about \$1,400 Moreover, we project that most owners would rapidly recover the initial cost of these technologies due to the associated fuel savings, **usually in less than two years**, as shown in the payback analysis in Section IX." Environmental Protection Agency & Department of Transportation (NHTSA); Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2; Proposed Rule, 80 Fed. Reg. 40138, 40272 (July 13, 2015) (emphasis supplied).

proportional to velocity cubed. Those transportation applications that operate at the lower speeds – such as urban delivery, food service, and many short-haul operations – will not achieve significant fuel savings (which, of course, correlates directly to reduced CO₂ emissions) from the aerodynamic devices. Those users have no need for the devices, and requiring installation for those applications accomplishes little if anything.

In other words, the free market efficiently self-selects which applications should install the aerodynamic devices on trailers – the Agencies themselves note that operators have every incentive to do just this. As discussed later, the Proposed Rule imposes substantial regulatory and administrative burden on the trailer-manufacturing industry. There is neither a need nor justification for adding layers of mandates and regulations where the market has every incentive to achieve the same results through voluntary compliance. The Proposed Rule is silent on this topic.

2. THE PROPOSED RULES’ PROJECTED GREENHOUSE-GAS REDUCTIONS ARE BASED ON UNREALISTIC ASSUMPTIONS THAT FAIL TO ACCOUNT FOR REAL-WORLD CONDITIONS AND THAT IGNORE INCREASES IN GREENHOUSE GASES CAUSED BY THE PROPOSED RULES.

The Agencies project a 2.35% (2018) to 9.4% (2027) decrease in CO₂ emissions from tractor-trailers by adopting the required technologies.² Those technologies yield benefits in two ways: decreasing road friction (through low-rolling-resistance tires; automatic tire-inflation systems; and weight reductions), and decreasing aerodynamic drag (through side skirts, trailer tails, and other air-deflection devices).

The Agencies will never achieve their projected savings attributable to aerodynamic devices. This is because the projected reductions are based on assumptions that are completely unrealistic, do not account for actual conditions operators encounter every day, and ignore the increases in greenhouse gases caused by adopting the Proposed Rules. The **net** savings attributed to aerodynamic devices will be marginal, at best.

² See Environmental Protection Agency & Department of Transportation (NHTSA); Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2; Proposed Rule, 80 Fed. Reg. at 40268 (Table IV–12) & 40271 (Table IV–16) (comparison of base emissions vs. proposed standards). For comparison, the Agencies projected a 10-12% reduction in greenhouse gases attributed to adoption of SmartWay technology. Office of Transportation and Air Quality U.S. Environmental Protection Agency and National Highway Traffic Safety Administration U.S. Department of Transportation, *Final Rulemaking to Establish Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles — Regulatory Impact Analysis*, EPA-420-R-11-901, p. 11-6 (August 2011).

2.1. The Agencies employ unrealistic speed assumptions.

The Agencies premise their projected aerodynamic savings on a computation concerning how much those aerodynamic devices will reduce drag. Drag reduction, of course, is determined both by how much more efficient the particular device is, and – more significantly – the trailer’s speed. As mentioned earlier, because aerodynamic drag is a function of velocity squared, aerodynamic drag forces are not relevant at speeds much below cruising speeds.

The Agencies’ GEM model, however, computes savings based on the completely unrealistic assumption that trailers travel at the following speeds for the following percentage of time:

65 mph cruise — 86%
55 mph cruise — 9%
“Transient” — 5%³

On their face, these assumptions bear no relationship to how tractors and trailers operate on America’s highways. Nor should they, because in reaching these speed assumptions the Agencies decided to ignore the significant amount of time the tractor/trailers spend idling, thus artificially boosting the percentages of time at higher-speed.⁴

It is both meaningless and misleading to compute projected fuel savings (and thus greenhouse-gas reductions) based on this unrealistic speed distribution, particularly when real-world data shows a dramatically different speed profile among trailer fleets. Utility Trailer obtained real-world speed data from four fleets showing the percent of time the fleet’s tractor spent at each speed; two of the fleets are long-haul, nationwide carriers traveling both in the United States as well as Mexico and Canada; two are regional fleets for food-service customers. All operate long-box trailers and use a mix of refrigerated and dry-van trailers. Data recorders logged the percentage of time the tractor/trailer was operating at each speed between 0 mph and 70 mph. One of the fleets recorded data for 4,000 tractors operating over

³ See, e.g., Environmental Protection Agency & Department of Transportation (NHTSA); Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2; Proposed Rule, 80 Fed. Reg. at 40265 (Table IV); see also Office of Transportation and Air Quality U.S. Environmental Protection Agency and National Highway Traffic Safety Administration U.S. Department of Transportation, *Final Rulemaking to Establish Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles — Regulatory Impact Analysis*, EPA-420-R-11-901, Chapter 4 – Vehicle Simulation Model (August 2011).

⁴ Office of Transportation and Air Quality U.S. Environmental Protection Agency and National Highway Traffic Safety Administration U.S. Department of Transportation, *Final Rulemaking to Establish Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles — Regulatory Impact Analysis*, EPA-420-R-11-901, p. 3-41 (August 2011).

a 6-month period; another (with the highest average speed) randomly sampled 15 tractors; and a third provided data for 26 randomly sampled tractors. The fourth fleet did not provide detailed speed data recorded by data recorders; instead, it provided its calculations of the amount of fuel saved at various speeds. This was based on data from 342 tractors, which ran between 69,457 and 2,496 miles, with most travelling roughly 30,000 miles during the time records were kept.

The real-world speed data the fleets provided to Utility Trailer (denominated Fleet 1, Fleet 2, and Fleet 3) differ dramatically from that the EPA used in its GEM model in generating the assumed savings. The following spreadsheet (and graph) shows the difference. The Agencies based their definition of “transient” on that employed by the California Air Resources Board, which defined “transient” as speeds between 0 mph and 47 mph, with an average speed of approximately 15 mph. For purposes of the speed chart, “transient” is listed in the nearest speed category, 17.5 mph.

% OF TIME AT SPEED – EPA VS. REAL-WORLD DATA

Cruising Speed [mph]	EPA % Time @ Speed	Fleet 1 % Time @ Speed	Fleet 2 % Time @ Speed	Fleet 3 % Time @ Speed
0.00	0.00%	38.57%	14.70%	20.26%
2.50	0.00%	2.37%	1.76%	2.33%
7.50	0.00%	2.38%	2.39%	3.60%
12.50	0.00%	1.53%	1.48%	2.80%
17.50	5.00%	1.13%	1.05%	1.81%
22.50	0.00%	1.03%	1.04%	1.50%
27.50	0.00%	1.13%	1.13%	1.07%
32.50	0.00%	1.23%	1.18%	2.80%
37.50	0.00%	1.47%	1.29%	1.38%
42.50	0.00%	2.35%	1.71%	1.60%
47.50	0.00%	1.78%	2.50%	1.14%
52.50	0.00%	4.35%	6.37%	1.50%
55.00	9.00%	3.15%	6.78%	4.05%
57.50	0.00%	4.25%	10.29%	3.74%
59.50	0.00%	10.62%	12.41%	3.74%
61.50	0.00%	19.63%	12.10%	5.00%
63.50	0.00%	1.68%	11.64%	15.60%
65.00	86.00%	1.35%	10.19%	25.71%
70.00	0.00%	0.00%	0.00%	0.38%

The following graph shows the same “percent-of-time-at-speed” information, comparing the actual recorded speeds of the three fleets to the assumption in the GEM model. The data shown is the average percent of time at each speed for each fleet.

What is plain from the spreadsheet and graph is that the GEM assumption concerning the percent of time the tractor-trailers spend at higher speed dramatically exceeds what the real-world data shows. In fact, the weighted average speed of the GEM model equates to 62 mph and the average speed for these three fleets varies from 30 mph to 45 mph.

To demonstrate further how far removed the EPA's GEM model speed assumptions are from the real world, one can focus only on Fleet 2, the Fleet that had the highest average speed of the three fleets. As shown in the following graph, the differences persist even with these assumptions favorable to the EPA's GEM model. Even in this fastest fleet, the single fastest tractor sampled was Truck 65000, which spent just 33.18% of the time at 65 mph, compared to 86% for the GEM model. Its average speed was 49 mph compared to the GEM average speed of 62 mph. And the slowest was Truck 651007 at 39 mph.

In addition to the information from the three fleets just summarized, Utility Trailer obtained information from a fourth fleet. This fleet's data did not show amount of time the tractor-trailer operated at each speed. Rather, the data showed the amount of fuel that fleet's tractors burned at various speeds. Tracking data over a total of 68 weeks encompassing 9.47 million miles, that data showed that 93.8% of the fuel consumed by the fleet was consumed at speeds lower than 55 mph. This confirms the relatively small gains available from tractors operating at higher speeds.

The vast difference between the GEM assumptions and what happens in the real world is crucial to assessing the validity of the Agencies' projected CO₂ reductions. Tractor/trailers with lower average speeds will benefit less from trailer aerodynamic devices. Additionally, to produce valid data, projected speeds must also account for the routes typically driven by a given fleet. Routes in rural areas are likely to be different from urban routes, and routes along the plains will have a higher average speed than mountainous routes. Differences in state speed limits and typical weather conditions also must be factored in. The Agencies' GEM model accounts for none of these factors.

2.2. The GEM model significantly overstates anticipated aerodynamic savings.

To estimate accurately the cruise-speed fuel savings of a specific trailer aerodynamic device, first the aerodynamic fuel savings attained at each speed must be multiplied by the average percent of time the tractor in a fleet travels at that

specific speed. Then, the individual speed savings must be summed to an expected average fuel savings. The Agencies have failed to provide such a study using real-world speed data from in use tractors and trailers. Rather, by using the far-too-high GEM assumed speeds, the Agencies have significantly overstated the anticipated fuel savings from the aerodynamic devices.

Appendix 1 to this submission describes in detail how the efficiency results were calculated. Using that Appendix, it is easy to track the conclusions stated in Sections 2.2.1 and 2.2.2.

2.2.1. Real-world savings from side skirts are substantially less than projected in the GEM model.

Table 1-1 in Appendix 1 shows the drag force associated with the trailer, and the reduction in drag – projected fuel savings – achievable with side skirts at 19 specific speeds between 0 and 70 mph. That table also shows the minimal savings skirts provide at lower speeds – less than 1% at speeds below roughly 35 mph.

Using this projected fuel savings at each speed, it is possible to calculate the weighted average of fuel savings from skirts from the EPA's GEM model, and for each of the three fleets for which we have real-world speed data. As noted previously, the EPA's GEM study assumes only three speeds: 65 mph (86% of the time); 55 mph (9% of the time); and “transient” (assumed 17.5 mph – 5% of the time). The weighted average of the fuel savings at each of these speeds is 1.99%, as shown in Table 1-6 in Appendix 1.

In contrast, when real-world speed data from the three fleets is used to compute the efficiencies of side skirts, the weighted average savings range between 0.95% (Fleet 1) and 1.43% (Fleet 2), depending on the speed profile of the fleet. See Table 1-6 in Appendix 1.

If cruising speeds below 55 mph are ignored, the GEM model fuel savings is reduced slightly compared to the fleet's fuel savings because the GEM model assumes (9% @55 mph + 86% @ 65 mph)=95% of the time from 55 mph to 65 mph. At 65 mph and above, the cruise speed fuel savings for the GEM model is (1.79%), for Fleet 1 is (0.03%), for Fleet 2 is (0.21%), and for Fleet 3 is (0.54%). So, at this level, Fleet 3 provides greater savings than does Fleet 2.

The following table and graph summarizes these comparisons.

% FUEL SAVINGS – SIDE SKIRTS

Speed Range	EPA % Time @ Speed x % Savings at Speed	Fleet 1 % Time @ Speed x % Savings at Speed	Fleet 2 % Time @ Speed x % Savings at Speed	Fleet 3 % Time @ Speed x % Savings at Speed
0-70 mph	1.99%	0.95%	1.43%	1.29%
55-70 mph	1.94%	0.78%	1.23%	1.17%
65-70 mph	1.79%	0.03%	0.21%	0.54%

The percentages of time at each speed for each fleet are averages for the entire fleet. Within the fleets, the tractor speeds exhibit substantial variation. As noted earlier, Fleet 2 shows the highest average speed. But even within that Fleet 2, the fuel savings for both the fastest and the slowest tractors are well below the EPA GEM assumptions:

% FUEL SAVINGS @ IDEAL CRUISE CONDITIONS – TRAILER SIDE SKIRTS ONLY

Speed Range	EPA GEM	Fleet 2 Truck # 65000	Fleet 2 Truck # 651007
0-70 mph	1.99%	1.58%	1.24%
55-70 mph	1.94%	1.45%	1.02%
65-70 mph	1.79%	0.49%	0.08%

Even for the tractor that had the highest average speed in the fleet that itself had the highest average speed, the fuel savings nowhere approximate those of the GEM model.

2.2.2. Real-world savings from side skirts combined with trailer tails are substantially less than projected in the GEM model.

The EPA’s model assumes that combining side skirts with trailer tails yields the most significant aerodynamic savings. According to the EPA, the skirt/tail combination produces a fuel savings of 5.56 %. Again, this conclusion depends upon the GEM model’s assumption that the tractor-trailer travels at 65 mph 86% of the time, and at 55 mph another 9% of the time.

The following table shows the fuel reductions as calculated by the EPA and as determined using real-world data.⁵ When actual speed data from the three fleets is used, the efficiency savings attributed to the skirt/tail combination drops by 28%, 35%, or 52% from the EPA estimates for 0–70 mph, depending on which fleet is used for comparison to the EPA’s GEM-model projections. In addition, they all are less than 3.5% at 55–70 mph, and less than 1.25% at greater than 65 mph, all under *ideal* conditions.⁶

⁵ These calculations are described in Appendix 1 – using real-world speed data from the three fleets – at various speeds.

⁶ Utility Trailer developed this information in the same way as it developed the statistics for efficiency of trailer skirts, but it reduced the drag coefficient to 0.423, the appropriate number with 0-degree yaw as determined by the computational fluid dynamic analysis performed by Exa Corporation.

**% FUEL SAVINGS AT IDEAL CRUISE CONDITIONS
COMBINATION OF TRAILER SKIRT AND TRAILER TAIL**

Speed Range	EPA % Time @ Speed x % Savings at Speed	Fleet 1 % Time @ Speed x % Savings at Speed	Fleet 2 % Time @ Speed x % Savings at Speed	Fleet 3 % Time @ Speed x % Savings at Speed
0-70 mph	5.56%	2.67%	4.00%	3.61%
55-70 mph	5.45%	2.19%	3.43%	3.27%
65-70 mph	5.01%	0.08%	0.59%	1.52%

The fuel savings generated from the combination trailer skirt and trailer tail, even under ideal cruising speed conditions, are very likely too small to be measurable in the field.

But even these extremely modest fuel-efficiency gains overstate the results that will occur when the technology is actually mounted on trailers. Putting aside the fact that the estimates assume, unrealistically, that all trailers operate at optimum cruise conditions – level roads, no speed changes caused by traffic fluctuations, perfect weather, and the like – these estimates fail to account for human behavior: drivers do not want to deploy the trailer tails.

Fleet 1 and Fleet 2 recently have installed trailer tails on many of the trailers in their fleet; one of the fleets has used auto deploy. But in both instances, the tails are not routinely deployed. A survey recently completed reported that the trailer tails were not deployed 58% of the time, even with auto deploy. This means that the drivers may be disabling the auto deploy feature and or the feature is still not reliable. A different fleet with trailer tails without auto deploy reported that the tails were not deployed over 20% of the time.

The reason for the significant incidence of nonuse is that drivers consider deploying the tail to be a nuisance. Even with the auto-deploy feature, retracting the tail remains a chore for the driver since retraction is not automatic. More importantly, fleets often hold the drivers responsible for any damage to the tractor or trailer; drivers cannot see the tails when deployed, and the tails are easily damaged by both the trailer they are attached to and by the trailers parked adjacent to them.

When other real-world factors are to be included, like the percentage of time that tractors accelerate or drive on significant road grades, in traffic, poor road conditions, etc; the amount of fuel used for only ideal cruising conditions would diminish and so would the fuel savings and GHG emissions for a given trailer aerodynamic device. Because of these varying factors and a small predicted fuel

savings under ideal conditions that are not measurable, it would be better for the Agency to continue its voluntary program in regards to trailer aerodynamic devices.

2.2.3. The EPA's various test methods for establishing aerodynamic-drag coefficient are not repeatable.

The scientific method requires that test results be repeatable, verified by third parties, and that equivalent tests yield equivalent results, all within reasonable margins of error. Coastdown, constant-speed, and various wind-tunnel test results – which the EPA used – are not necessarily repeatable over time and by third parties. This is especially likely for tests that use human drivers. Utility Trailer has conducted fuel-savings tests of the same model side skirt at different times at the same facility, and at different test facilities. Although Utility Trailer employed identical test protocols, the results varied significantly.

A vetted computational fluid dynamic (CFD) test controls for these variations. Utility Trailer employed Exa Corporation (the same entity used by the EPA) to perform CFD tests on the proposed aerodynamic devices. Exa Corporation advised Utility Trailer to increase the aerodynamic drag area provided by the EPA's Table 2-76 by 25% to match the CFD model to the EPA's coastdown test results. Although this adjustment roughly approximated the results the EPA achieves from the coastdown test, it does not produce equivalently acceptable results for the constant-speed or wind tunnel method of computing the aerodynamic-drag coefficient. This calls into question the validity of the EPA's tests used to establish the aerodynamic-drag coefficient. The Agency has failed to provide a proper analysis of equating the various test methods to one another; it also has not confirmed the results by independent, valid testing.

2.3. The Proposed Rule fails to account for the increases in greenhouse gases that will result from the Rules; they do not measure net greenhouse gas effects of the devices.

A proper analysis of the greenhouse-gas reduction resulting from implementing the Proposed Rule would speak of the net effect on greenhouse gases by accounting from increases in emissions resulting from the Proposed Rule. The Proposed Rule largely fails to do this, even though the Rule will result in activities that will increase greenhouse gases.

First, manufacturing the devices results in unwanted greenhouse gas emissions. The aerodynamic devices typically are constructed from lightweight metal, plastic, and – particularly for the skirts – polymers and glass fiber. Many of these materials require extreme heat and significant quantities of petrochemicals to produce, as well as the energy expended in the mining or manufacturing process. The materials also must be transported to the factory and repair shops, and

additional fuel is required, of course, to move a trailer with the additional weight of the devices attached.

It is not easy to determine the amount of greenhouse gases or CO₂ emitted from these trailer devices; it certainly is not negligible, and the Agencies should not ignore it or assume it is negligible. But as written, the Proposed Rule neglects the fuel costs and greenhouse-gas emissions associated outside of operations on the trailer. The Proposed Rule needs to account for the greenhouse gases and energy consumption of various devices during the entire lifetime of the component's construction, delivery, use and disposal, rather than just highway use as it does now. It would be pointless to require the use of devices whose greenhouse-gas savings in use are small compared to the greenhouse-gas emissions resulting from production, delivery, maintenance, retreading, disposal, and the like.

Additionally, any computation of the additional greenhouse-gas emissions associated with manufacturing and repairing the aerodynamic devices must account for the fact that there is not a 1-to-1 ratio of tractors to trailers. The GHG-2 Impact Analysis acknowledges that there are typically two long-refrigerated box trailers per tractor and three (and sometimes up to six) long-dry-van box trailers per tractor.⁷ The fuel savings analysis ignores this reality. When these multipliers are included, the number of trailer aerodynamic devices required to achieve the savings is basically doubled or tripled, and by extension, the amount of GHG (CO₂) emissions reductions required to make up for the total the GHG emissions caused by their fabrication, installation, and maintenance.

Second, the Proposed Rule ignores that the aerodynamic devices are not one-time purchases; rather, they are unlikely to survive more than a fraction of the trailer's expected life and therefore must be replaced multiple times. Our freight trailers are expected to last 15 years on average. There is no data to suggest that the aerodynamic devices will last nearly that long. The aerodynamic trailer devices have only been available since 2010. Early-adopter fleets (having approximately 5,300 trailers with skirts) have reported spending \$1.2 million over 5 years repairing or replacing damaged skirts and trailer tails on their long-box trailers.

Skirts, for example, dwell in space beneath the trailer where objects regularly intrude. Whether it is railroad tracks, inclines on loading docks, or road debris, the skirts will be abused. Utility Trailer and the other manufacturers know this from real-world use, as shown by the following two photographs that reflect a frequent result when the skirts encounter real-world intrusions into their space.

⁷ Office of Transportation and Air Quality U.S. Environmental Protection Agency and National Highway Traffic Safety Administration U.S. Department of Transportation, *Final Rulemaking to Establish Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles — Regulatory Impact Analysis*, EPA-420-R-11-901, p. 11-5 (August 2011).

Tails encounter similar problems. As noted, the driver cannot see the tail when it is deployed, and drivers often forget to retract the tail and then back into a fence or dock, damaging the trailer. Additionally, because the tail causes the door when fully opened to rest further away from the side of the trailer, drivers catch the door on another trailer when backing in or pulling out, as shown by the following photograph. Such damage requires repairing or replacing the doors, as well as the devices themselves.

Third, the aerodynamic devices add weight to the trailers. A typical combination of skirt and tail adds between 300 and 350 pounds to a trailer. This is a problem for all trailers, since added weight means added fuel usage. But it also presents additional problems for that high percentage of trailers (often but certainly not exclusively refrigerated trailers) that weigh out rather than cube out. Adding the weight of trailer aerodynamics will typically displace hundreds of pounds of payload per trip and thus cause additional trips to be made to deliver the same amount of product. This not only negates the fuel savings of the trailer aerodynamic device, but also adds to traffic congestion and increases carbon emissions for all vehicles on the road.

Requiring the trailer industry to affix trailer skirts and tails to all trailers in the hopes of achieving questionable aerodynamic efficiencies is not a wise policy choice. The Agencies have not done a satisfactory job of determining the savings that will result from the aerodynamic-device requirements. What is known is that

the projected efficiencies depend on assumptions that are demonstrably unrealistic, and that when real-world data is used to perform the efficiency calculations, the projected efficiencies – even in an ideal environment – drop dramatically. Additionally, the savings even then are overstated because they do not account for the net decrease in emissions, ignoring emissions caused in manufacturing and transporting the devices, in replacing the devices, and in the added weight affixed to the trailers. The better option is to allow the industry to continue its practice of voluntarily adopting these technologies in those uses where it makes sense to do so. This is a proven approach. Accordingly, Utility Trailer requests that the aerodynamic device requirement be removed from the proposed EPA Phase 2 Rule. In other words, the term “ $C_3 \cdot (\Delta C_D A)$ ” should be removed from the equation, and the maximum “eCO₂” grams per ton-mile should be adjusted downward to compensate equivalently.

3. THE AGENCIES’ COST-BENEFIT ANALYSIS IS FLAWED.

Executive Order 12866,⁸ which applies to significant rules issued under the Clean Air Act, requires the Agency to assess systematically the regulation’s costs and benefits.⁹ The Agency properly acknowledges this obligation, and refers to its Regulatory Impact Analysis, in the Proposed Rulemaking.¹⁰ Although the Agency has set forth its conclusions in this regard, the analysis is flawed as it significantly overstates the benefits and understates the costs associated with the Proposed Rule.

3.1. Failure to use real-world speed data overstates the benefits of the Proposed Rule.

As noted earlier, the calculated emission benefits are based on speed assumptions that are radically different from those exhibited day-to-day on America’s highways. By significantly overstating the amount of time spent at high-speed operations, the speed at which aerodynamic devices actually may provide a real benefit as aerodynamic drag at that point is roughly equivalent to the drag from non-aerodynamic friction, the estimates describe benefits that never will be achieved in the real world.

⁸ Exec. Order No. 12866, 58 Fed. Reg. 51735, 51738, 51741 (1993) (applying to all rules with an annual economic effect of at least \$100 million).

⁹ *Michigan v. E.P.A.*, 135 S. Ct. 2699, 2715 (2015).

¹⁰ See Environmental Protection Agency & Department of Transportation (NHTSA); Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2; Proposed Rule, 80 Fed. Reg. at 40541–49.

3.2.Failure to consider the need to replace and repair the drag-reduction technologies overstates the benefits of the Proposed Rule.

The Agencies' estimates understate the costs by failing to account for the emissions associated with replacing the items and repairing damaged trailers. At the more micro level, the touted cost-benefit calculation for the owner – savings in two years will pay for the devices – also is inaccurate in that the calculation does not account for the cost of replacing items or repairing trailer damage. Moreover, virtually none of those operators will see the fuel-reduction benefits described in the Proposed Rule for the reasons described previously.

Additionally, the Proposed Rule fails to account for the costs associated with increased tire wear for low-rolling-resistance tires. Because low-rolling-resistance trailer tires are stiffer, they wear faster due to tire scrubbing, curbing, and other wear and tear. Scrubbing is a particular problem for the long-box trailers, as the “long wheel base” provides sufficient mechanical advantage, or leverage, to the tractor to easily scrub the trailer tires with a standard 49-inch axle spread and even an optional 121”-axle spread. Also, urban routes with tighter maneuvers are more susceptible to scrubbing. The stiffer low-rolling-resistance trailer tires are likely to be more vulnerable to wear under these conditions. The TMC, the maintenance council division of the American Trucking Association recently published their findings on LRR tire wear for tractors and trailers where they report that low-rolling-resistance trailer tires are wearing sooner than conventional standard tires.¹¹

¹¹ American Trucking Association's Technology & Maintenance Council – S.2 Tire & Wheel Study Group. March 2015. The “Trailer Tire Mileage” graph appears in the following web-published article: Park, J. (2015, March 1). TMC Survey Reveals Misinformed View of Fuel-Efficient Tires. Retrieved September 25, 2015, from <http://www.truckinginfo.com/channel/fuel-smarts/article/story/2015/03/tmc-tire-survey-reveals-discrepancy-in-fleet-view-of-fuel-efficient-tires.aspx>.

Standard trailer tires outperformed low-rolling-resistance trailer tires by an average of 4,000 miles. Increased tire replacement or retreading and replacement will contribute to greenhouse-gas emissions and mitigate the emission reduction from claimed from using low-rolling-resistance trailer tires. The Agencies have failed to consider this in their GEM Model and Proposed Rule.

3.3. The cost-benefit calculation is flawed because it fails to give safety adequate consideration and weight.

The aerodynamic devices specified by the EPA are relative newcomers to the market. Manufactured of plastic, fiberglass, and light metal, they are easily damaged as the trailers travel over the road and railroad crossings, or – in the case of trailer tails – as drivers routinely back into docks, fences, and other trailers. Some number of these devices will become detached in over-the-road operations, resulting in some number of increased accidents.

The additional technologies are also likely to increase accidents and the injuries and fatalities associated with them. As noted previously, adding the aerodynamic technologies to trailers that otherwise would run at full permitted weight will mean that cargo equal to the weight of the devices will have to be transported on additional trips. There is a correlation – some would say direct – between miles driven and accidents/injuries/fatalities. The Agencies have not accounted for this important societal cost in performing their cost-benefit analysis.

Finally, the effect of implementing a combination of technologies on a large scale is not yet sufficiently evaluated to be certain that there will not be unintended consequences. Other than its own side skirt, Utility Trailer does not know of any other aerodynamic device that has been certified to meet or exceed relevant DOT

regulations. For example, some vendors market devices to cover the ends of axles, claiming they will reduce drag. But covering the wheel end may reduce airflow, causing the components to run hotter. Before installing such devices, a prudent manufacturer would require approval from the axle supplier, the bearing supplier, the hub supplier, the oil-seal and hubcap supplier, the lubricant supplier, the brake supplier, the wheel supplier, and the tire supplier.

4. AUTOMATIC TIRE INFLATION IS UNNECESSARY.

Even with an automatic tire-inflation system, a prudent operator should check tire pressure manually. This is because systems become damaged, because the systems are not foolproof, and because at times the systems add pressure to cold tires, but the pressure increases beyond the recommended maximum level as the tires heat during normal operation. Only by checking the tires manually can the operator be sure that the tires are actually at optimal pressure.

Of course, many trucking fleets already have incorporated ATI systems in their trailer fleets, and they have invested the facilities and expertise to manage them properly. They believe that it is easier on drivers and saves tire wear. But this is not a reason to foist the system on all operators, particularly when prudent operators will check pressure manually in any instance.

Additionally, most of the automatic-tire-inflation systems on the market only add air to the tires; they do not remove the air when the tires are overinflated. But as noted, overinflation is a concern when air is added to tires that are cold. Overinflation, however, increases the rate of tire wear, which increases net greenhouse-gas emissions.

The Agencies have not demonstrated that the tire-inflation systems will generate sufficient savings verses the manual method to justify their adoption, nor have they considered the erosion of any benefits that will occur as the systems overinflate tires and decrease tire life, resulting in increased greenhouse-gas emissions. For this reason, Utility Trailer urges the Agencies to remove automatic tire inflation system from the proposed EPA Phase 2 Rules. In other words, the term “• C5” at the end of the equation should be removed, and the maximum “eCO₂” grams per ton-mile should be adjusted up to compensate equivalently.

5. THE AGENCIES’ COMPLIANCE PROGRAM IS FLAWED; THE PROPOSED RULE SHOULD DELETE AVERAGING AND BINS FROM ITS COMPLIANCE MODEL AS THE MODEL AS DRAFTED IMPOSES A SIGNIFICANT ADMINISTRATIVE BURDEN AND ALLOWS CUSTOMERS TO GAME THE SYSTEM.

As noted earlier, Utility Trailer does not believe the Agencies’ Proposed Rule is necessary. The free market is quite capable of continuing to obtain increasing fuel

efficiencies while allocating as appropriate the resources needed to accomplish those goals. Operators and trailers that would benefit from installing the technologies – or that would achieve the EPA’s estimated two-year payback – should install those technologies. The Agencies have not offered any explanation as to why the free market is incapable of producing the desired results.

But Utility Trailer also recognizes the political reality that the Agencies are unlikely at this point to rely on the free market to continue to solve this problem. Utility Trailer therefore offers the following suggestions to improve any Rule the Agencies adopt.

The compliance program – with its system of averaging and bins – is unduly complex and unsuited to the trailer industry. Utility Trailer urges the Agencies to streamline the compliance aspects of the program in a way that will decrease the administrative burden on the trailer manufacturers while providing the Agencies with the level of compliance desired. Specifically, the compliance program should be modified as follows:

- Develop clear categories of trailers that will be exempt from the Proposed Rules. These categories should include considerations of trailer configuration and the use that will be made of the trailer, including the environments and areas in which it will operate. Exemptions could relate only to some of the technologies required by the Proposed Rule.
- Allow manufacturers to certify by label that the trailers manufactured comply with applicable Agency regulations.

5.1. The Agencies should develop clear use and category exemptions.

The Agencies’ Proposed Rule recognized that the proposed aerodynamic modifications are incompatible with certain trailer designs. For example, trailer tails are not designed to work on roll-up doors, and skirts are often incompatible with storage boxes and tire carriers mounted under the trailers.

In addition to exempting such trailers from the Proposed Rule, Utility Trailer urges the Agencies to establish clear exemptions for trailers that would be used in certain operations. In these operations, the technologies are either incompatible with the options most often selected for that use, or the anticipated benefit from the technologies is extremely low due to the environment in which the trailers will operate. The trailer manufacturer would install a label on every manufactured trailer within this category, which would certify both the customer’s representation as to the use of the trailer and as permanent identification that the trailer is exempt. If the trailer’s use changed, or the customer sold the trailer to another user, the label would be removed.

Specifically, the following categories / uses of trailers should be exempted:

- Short-haul trailers that will travel fewer than 100 miles per day. Even California recognizes that aerodynamic regulation of such trailers is not cost-beneficial, as it exempts them from the side-skirt requirement in California. A similar exemption from the Proposed Rule's requirements is appropriate.
- Local delivery operations, particularly those in urban environments. A significant number of these trailers are outfitted with devices – such as roll-up doors, liftgates, or side ramps – incompatible with the aerodynamic technologies. Additionally, these trailers usually operate at lower average speeds, negating any anticipated aerodynamic savings. Finally, as noted earlier, low-rolling-resistance tires are not a good fit for these applications, as they lead to increased scrubbing and damage.
- Trailers with greater than 121" axle spreads should avoid low-rolling-resistance tires, as the large axle spread causes increased scrubbing, particularly with the stiffer tread formulations in those tires.

5.2. The Agencies should delete the bin-and-averaging approach currently described in the Proposed Rule and permit manufacturers to certify their compliance with the Rule rather than obtaining Agency approval for each plan year.

The Agencies' proposed bin-and-averaging compliance model is unmanageable in the trailer-manufacturing industry. Utility Trailer and the other major manufacturers build semi-custom trailers. Although orders start with a base model and standard options, customers routinely add a large number of customer-specific options. Additionally, customers make numerous specification and quantity changes throughout the process, often up to the time actual manufacture of the unit begins. Some of these option changes, as noted previously, conflict with the aerodynamic devices.

Utility Trailer urges the Agencies to adopt a simpler, more straightforward approach: require the original equipment manufacturer to install specific approved devices on all non-exempt trailers. This provides the following advantages.

First, it is manageable. The administrative burden required by the Proposed Rule is oppressive. The Proposed Rule would require each manufacturer to obtain Agency approval before the start of each year of a plan for weighted average compliance to the GEM formula for all production. Then, at the end of the year, the manufacturer would need to obtain Agency approval of the actual production results

and for rollover into the next year. Also significant is the administrative burden associated with scheduling production slots and allocating those requiring different complying devices throughout the year. Because of the assembly-line manufacturing process, it is far more efficient to avoid changing technologies from order to order, to the extent practical.

Far simpler and equally effective would be to require each manufacturer to install a label on each trailer certifying to that compliance and to keep records of the weighted averages to achieve compliance if the averaging approach is part of the Rule. The Agency, if it desired, could inspect those records as needed. This would be approximately the same system as trailer manufacturers use to comply with the NHTSA's Federal Motor Vehicle Safety Standards. This is a time-proven, successful system.

Second, eliminating averaging avoids gaming the system. The Agencies' one-size-fits-all approach is unworkable in the trailer industry. For many operators, the aerodynamic devices are unworkable or undesirable. But because the Proposed Rule requires the manufacturer to achieve an average specified reduction in aerodynamic and rolling-resistance drag (i.e., some of its trailers will have a grouping of the devices (bins); others wouldn't), the manufacturer will be placed in the position of deciding which customers must buy the devices and which ones will be exempt. This provides huge incentives for larger fleets to use their market pressure to force the manufacturer to exempt them from purchasing the devices the larger fleets do not want, leaving the smaller customers without market power to purchase a disproportionate amount of the technology. This, of course, would also increase costs for the smaller competitors.

Thus, we urge the Agencies to modify the requirements from a maximum CO₂ output in grams per ton-mile as currently proposed. Rather, the requirements should be written to specify types of drag-reducing devices that meet specific qualification requirements for all non-exempt trailers.

5.3. The Agencies should permit manufacturers to submit efficiency numbers for their aerodynamic technologies that include realistic yaw angles.

The Proposed Rules permit manufacturers and suppliers to use alternative devices to achieve the required greenhouse-gas emission reductions, provided they establish the efficiency of those devices. The GEM model, however, requires that the efficiency be established at 0-degrees yaw – in other words, without cross winds. And for model years 2021 and beyond, the EPA requires that all aerodynamic devices be qualified again with 0-degree yaw angle.

This requirement was done purely for the sake of the GEM model, regardless of the very significant and varying effect yaw angle has on the different aerodynamic device efficiencies. This is unrealistic and does not involve the real world, where

crosswinds are more common than not. Constant-speed and coastdown tests all permit some amount of wind. This biases their results as compared with other test methods of determining aerodynamic-drag coefficients.

Utility Trailer has performed computational fluid dynamic (CFD) analysis of many of the EPA SmartWay-approved trailer aerodynamic devices, using the same testing agency (Exa Corporation) that the EPA has employed for some of its tests. The EPA SmartWay-approved trailer side skirt reduce the tractor/trailer aerodynamic drag coefficient the most, especially with cross winds or with a significant yaw angle. As Utility Trailer and other manufacturers develop new devices and configurations to increase aerodynamic efficiencies, Utility Trailer urges the Agencies to permit the manufacturers to perform sufficiently sophisticated testing to account for the effect of yaw angle (crosswinds) on those devices. This will permit the proposed savings to better represent actual anticipated fuel efficiency savings.

5.4. Any Rule that the Agencies adopt should be reevaluated within a few years to account for uncertainties and changes, as well as availability of proven devices to comply with the Rule.

The Proposed Rule will establish regulations for the next dozen years and beyond. It is difficult, to say the least, to anticipate with any accuracy what the transportation, environmental, or regulatory landscape will look like at that time or what complying devices will be available. Rather than set guidelines now for those out years, Utility Trailer urges the Agencies to limit its adoption to proposals for the first 6 years – through 2021, with the understanding that the Agencies will revisit the topics as those deadlines approach to determine how the Regulations should be modified.

For example, even if it used all the currently available existing efficiency-improving devices set forth in the EPA tables in 100% of trailer production (automatic tire inflation systems, level 2 low-rolling-resistance tires, combination of skirts and trailer tales and a roughly 950 pound weight reduction in refrigerated trailers), Utility Trailer would not be able to qualify its long-box dry-van trailer for the years 2024 and beyond, and it would not be able to qualify its long-box refrigerated trailer for the years 2027 and beyond.

5.5. The Proposed Rule's warranty provisions are unworkable.

The Proposed Rule requires that all drag-reducing devices added to trailers be warranted for five years (one year for tires) to ensure that “these components and

systems are designed to remain functional for the warranty period.”¹² Putting aside any issues concerning the Agencies’ authority to prescribe warranties offered by manufacturers, the proposal is flawed. To the extent a warranty is provided, the warranty should be a pass-through warranty from the manufacturer of the device; the trailer manufacturer should not be required to offer a separate warranty, as it does not control the manufacture of many of those products.

Utility Trailer also has the following specific warranty concerns:

Tires: some users will wear through tires in less than a year. This hazard is magnified by the anticipated overinflation problems associated with widespread adoption of automatic tire-inflation systems, as described previously. Tire wear and road-hazard damage must not be covered under any warranty.

Skirts and trailer tails: As noted previously, these devices are damaged in routine operations. Manufacturers must have clear protections against turning normal wear and tear, collisions, or abuse into a warranty claim.

Tire-inflation systems: A 5-year warranty is excessive. Utility Trailer is not aware of any system that has a baseline warranty of more than 3 years. The proposed warranty period for these devices should be reduced.

5.6. The Agencies should modify the Rule to encourage customers to voluntarily adopt the technologies, and to encourage manufacturers to continue to develop new technologies.

Customers will understandably be concerned about the effect of the required technologies on their operations and bottom line. The Agencies could ameliorate these concerns somewhat by adding provisions to the Proposed Rule that would encourage customers to accept the new requirements. For example, exempting the required devices from excise taxes attributed to those devices, or permitting weight limits on trailers to increase by the weight of the added devices would make the technologies more attractive to the customers and mitigate some of the additional costs imposed by the regulations in the form of additional trips due to displaced cargo.

Additionally, the Agencies should consider modifying trailer width, length, and height limitations to accommodate required devices and to encourage new, more efficient aerodynamic configurations. For example, permitting trailer sidewalls and roof to expand in width and height, respectively, would allow potential future designs with rounding of the front and rear box-van corners in a more aerodynamic

¹² Environmental Protection Agency & Department of Transportation (NHTSA); Greenhouse Gas Emissions and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles – Phase 2; Proposed Rule, 80 Fed. Reg. at 40282

configuration. And measuring overall length at the allowed extreme width or height would permit manufacturers to consider rounding the front of the trailers without sacrificing capacity.

5.7. Manufacturers should be given credit for net weight reductions, regardless of whether the weight reductions are attributable to switching to aluminum components.

The Regulatory Impact Analysis focuses on weight savings in trailers by substituting aluminum for steel components,¹³ although other portions of the Analysis recognize that weight savings are possible with high-strength steel or other materials. Aluminum, though lighter than steel, often is not the best material for a given application, since it only has approximately one-third the stiffness and lower yield strengths than steel. Manufacturers are in an excellent position to determine the best materials for their trailers and the stresses those trailers will encounter. They should be encouraged to reduce the weight of their trailers, while maintaining strength and longevity. Accordingly, since the Agency associates weight reduction with fuel-efficiency savings, manufacturers should be given credit for any weight savings in their trailers, regardless of whether the savings come from redesign or substitution of materials, and if from substitution of materials, regardless of whether the previous material was steel, or whether the new material is aluminum, high-strength steel, plastic, or any other weight-savings material.

6. THE EPA LACKS AUTHORITY TO REGULATE THE TRAILER INDUSTRY.

Utility Trailer shares the view of the TTMA and other manufacturers that the EPA lacks authority to impose the proposed regulations on the trailer industry. It has included this discussion last in its comments not because it is the least significant. Indeed, this lack of authority normally should spell the end of the discussion. But one need only read the hundreds of pages of the Proposed Rule, including the strained arguments advanced by the EPA as to why it has determined that it does have the authority it seeks, to recognize that the EPA likely has already reached an unalterable conclusion on this issue and that any relief likely will have to come from another source.

Utility Trailer nonetheless includes this section both to emphasize its concern about this unprecedented expansion of authority by the EPA, and in the hope that more reasoned views will prevail.

¹³ Office of Transportation and Air Quality U.S. Environmental Protection Agency and National Highway Traffic Safety Administration U.S. Department of Transportation, *Final Rulemaking to Establish Greenhouse Gas Emissions Standards and Fuel Efficiency Standards for Medium- and Heavy-Duty Engines and Vehicles — Regulatory Impact Analysis*, EPA-420-R-11-901, p. 11-10 (August 2011).

The EPA's jurisdiction is limited to "motor vehicles." A trailer, of course, is not a motor vehicle, which the EPA's own regulations define as a "self-propelled vehicle." Despite this restriction, the EPA claims it is entitled to ignore the word "motor" in "motor vehicle" and claims jurisdiction because the trailer is designed to be used with the tractor, and together the trailer and tractor is a "motor vehicle."

This stretched interpretation of the EPA's own definition is plainly a results-driven interpretation and runs roughshod over the jurisdictional language that restricts its authority.

More importantly, the argument is fundamentally flawed. The EPA's position is that "***Connected together***, a tractor and trailer constitute 'a self-propelled vehicle designed for transporting ... property on a street or highway,' and thus meet the definition of 'motor vehicle'..."¹⁴ But the EPA's regulations are directed to the trailer manufacturer and impose regulations on the trailer at a time that the tractor and trailer are **not** connected together. In fact, the trailer is not connected to the tractor when the trailer is manufactured, when it is sold, when it is delivered, or for much of its existence. If the EPA intends to rely on the fact that being "connected together" provides the EPA with jurisdiction to regulate trailer aerodynamic, the EPA must focus on the entity that actually "connects together" the tractor and trailer. That entity is truly the "manufacturer" of the combined tractor/trailer. It certainly is not the trailer manufacturer. The EPA's strained interpretation of "motor vehicles" cannot justify its extension of jurisdiction under the Clean Air Act to areas that Congress did not intend the EPA to regulate.

Respectfully submitted,

Jeffrey J. Bennett
Vice President Engineering and Product Development
Utility Trailer Manufacturing Company

Utility Trailer conducted a computational-fluid-dynamics [“CFD”] fuel-savings study using an EPA-SmartWay-approved, advanced trailer side skirt with the trailer configured to be California compliant. That analysis provided aerodynamic drag coefficients for the tractor-trailer both with and without the side skirt. Using those drag coefficients (as well as rolling-resistance calculations), Utility Trailer determined the fuel savings at each speed, from 0-mph to 70-mph, on level highway, with no accelerations, changes in road grade, traffic, wind, or yaw angle. The fuel consumed under these ideal cruise conditions overcomes the frictional/drag resistance forces from the tire rolling resistance, from the tractor power train, and from aerodynamic drag.

More specifically, Utility Trailer used the following calculations and methodologies in establishing the various frictional/drag forces.

Rolling resistance. Utility Trailer used a rolling-resistance coefficient of 0.00672. This is the weighted average of the rolling resistance of the steer, drive, and trailer tires provided in Table 2-76 of the Agency's GHG-2 Impact Analysis, which assumed a total weight of 80,000 pounds (the U.S. Federal maximum weight) distributed as follows: steer tires – 12k; drive tires – 34k; trailer tires – 34k. The Agencies' Table 2-76 also provided the total mass for the tractor, trailer, and payload: 31,978 kg / 70,351 pounds, which is not the maximum allowed weight. Using the

standard formula of $RR = C \times M \times g$, or $RR = 0.006472 \times 31978 \text{ kg} \times 9.81 \text{ m/s}^2$, we calculated the rolling resistance for the tires.

Drive train friction. A tractor OEM provided 1,142 Newtons as an approximation of the drive-train frictional force.

Combining the rolling resistance and drive-train friction forces provided a constant rolling and drive-train drag force of 3,172.33 Newtons.

Aerodynamic drag. The formula for computing aerodynamic drag is $F = C_d \times A \times 0.5 \times (\text{density}) \times (\text{velocity})^2$. CFD established the applicable coefficients of drag to be 0.479 (trailer without side skirt) and 0.459 (trailer with side skirt), all assuming 0-degrees yaw angle, as stated in the GHG-2 Impact Analysis requirement. EPA's Table 2-76 provided both the aerodynamic drag area (10.38 m²) as well as the air density (1.2 kg/M³).

Exa Corporation – one of the testing consultants also used by the EPA – advised us to increase the aerodynamic drag area provided by the EPA's Table 2-76 by 25% to match the CFD model to real world drag forces measured from tests. Although this adjustment roughly approximates the results the EPA achieves from the coastdown test, it does produce equivalently acceptable results for the constant-speed or wind tunnel method of computing the aerodynamic-drag coefficient.

With these resistance assumptions, the friction and drag forces were calculated (in Newtons) for each speed ranging from 0-mph to 70-mph (0-meters/sec to 31.29-meters/sec).

The total friction and drag forces were combined for the base trailer (without the side skirt) and for the trailer with the side-skirt configuration. The combined force for each tractor-trailer configuration was then multiplied by the speed (meters/sec) and divided by 1000 Watts/KW to arrive at the power used in kilowatts. The percent difference in power consumed between the base trailer and the trailer with the side-skirt configuration also represents the fuel saved at each specific speed.

Based on the methodology just described, the following Appendix Table 1-1 shows the calculation of drag forces at each of the speeds increments between 0 mph and 70 mph, and the resulting percentage of fuel savings at each of those speeds.¹⁵

¹⁵ Utility Trailer also developed similar efficiency information for trailers that had a combination of trailer skirts and trailer tails. The process of developing the efficiency data was the same as that employed for developing the data for trailer skirts, with the exception that it reduced the drag coefficient to 0.423, the appropriate number with 0-degree yaw as determined by the computational fluid dynamic analysis performed by Exa Corporation.

The following graphs show the information contained in Table 1-1 in graph form. Graph 1-2 shows how drag forces – both those associated with rolling resistance and power train and those associated with the trailer (both with and without the side skirt) change with speed. The drag forces used are those that appear in the columns labeled “Rolling Resistance & Power train drag Newtons”; “Drag Force [Newtons] Base Trailer”; and “Drag Force [Newtons] Trailer & Aero Device” in Table 1-1. Predictably, the rolling resistance/power train forces are constant, and the aerodynamic drag changes with speed.

Graph 1-3 combines the constant drag forces from rolling resistance/power train with the variable aerodynamic drag, and shows the variation of those forces with speed. The data in this graph appears in the column labeled “Total Drag Force [Newtons] Base Trailer” and “Total Drag Force [Newtons] Trailer & Aero Device” (which, in turn, is derived from the columns labeled “Rolling Resistance & Power train Drag Newtons”; “Drag Force [Newtons] Base Trailer”; and “Drag Force [Newtons] Trailer & Aero Device”) in Table 1-1.

Graph 1-4 shows the power required to overcome the combined drag forces that are shown in Graph 1-3. The data for this Graph appears in the columns labeled “Total Drag Power [KW] Base Trailer” and “Total Drag Power [KW] Trailer and Aero Device” in Table 1-1.

Graph 1-5 shows percentage of fuel saved for each speed when traveling 100% at that speed. The data for this Graph appears in the column labeled “% Change in Power (Fuel Savings).

As demonstrated by Graph 1-4, the fuel savings at 65-MPG is 2.08%. At all speeds below 65 mph, the savings are below 2.08%. What this means is that to obtain a 2.03% fuel savings, as suggested by the EPA, the tractor/trailer would have to average 65 mph for its entire life (assuming 0-degree yaw angle). This is not a real-world assumption.

To the contrary, the speed of the tractor/trailer varies significantly as it is operated in real-world conditions, and real-world data shows the average to be substantially below 65 mph. To compute the actual projected savings from side skirts, the aerodynamic fuel savings at each speed must be multiplied by the actual, measured percentage of time the tractor/trailer operates at each tractor speed. The results of these calculations are then summed to total the weighted average fuel savings for each fleet.

Table 1-6 summarizes data provided by three fleets that used data recorders to record actual speed data from thousands of tractor/trailers, as well as the time spent at those speeds. Speeds are divided into 19 increments beginning at 0 mph and ending at 70 mph. The data in the column labeled “% Change in Power (Fuel Savings)” is derived from Table 1-1. Following that are two columns each for each of the EPA and the three fleets for which we have actual speed data. The first of those columns provides the time at each speed. For the EPA, the time was based on the EPA’s assumption that 86% occurs at 65 mph, 9% at 55 mph, and 5% “transient,” which was put entirely at 17.5 mph. For the three fleets, the actual speed data was allocated appropriately among the 19 speed increments. The second of the columns multiplies the percentage of time at the speed by the fuel savings at that speed (assuming that skirts but not trailer tails are attached to the trailer) to produce the amount of savings at that particular speed. Finally, the data for the EPA and each of the three fleets is summed to provide the total efficiency across all reported speeds.

TABLE 1-6: TIME AND FUEL SAVINGS AT EACH SPEED – SKIRTS ONLY

Cruising Speed [MPH]	Cruising Speed [Meters/SE C]	% Change in Power (Fuel savings)	EPA % Time @ Speed	EPA % Time @ Speed x % Savings at Speed	Fleet-1 % Time @ Speed	Fleet-1 % Time @ Speed x % Savings at Speed	Fleet-2 % Time @ Speed	Fleet-2 % Time @ Speed x % Savings at Speed	Fleet-3 % Time @ Speed	Fleet-3 % Time @ Speed x % Savings at Speed

Total				1.96%		0.95%		1.43%		1.29%

Graph 1-7 displays the same information as Table 1-6. Because the EPA uses unrealistic speed assumptions, its projected efficiency is substantially higher than the efficiencies obtained from the real-world data.

GRAPH 1-7: TIME AND FUEL SAVINGS AT EACH SPEED – SKIRTS ONLY

The calculated weighted-average fuel savings across all speeds between 0-mph and 70-mph for the EPA's GEM model was 1.99%, vs. 0.95% for Fleet 1, 1.43% for Fleet 2, and 1.29% for Fleet 3. The difference in resulting fuel efficiency between the assumed EPA speeds and the real-world speeds from the three fleets is even more obvious if one focuses only on cruising speeds below 55 mph, summing only the savings attributable to speeds at 55 mph and above where the benefits of the aerodynamic technologies are greatest. The GEM model assumes the tractor/trailer operates at these higher speeds 95% of the time. Fleets 1, 2, and 3, respectively, show that the tractor/trailer operates at these higher speeds 40.68%, 63.4%, and 58.22% of the time, respectively. The associated fuel savings for each group of trailers at these speeds are 1.95% for the EPA GEM model, and 0.78%, 1.23%, and 1.17% for Fleets 1, 2, and 3, respectively.

Breaking down the savings into the speeds at which the devices are most effective - as shown in Table 1-8 and its corresponding Graph 1-9 – demonstrates the significance difference between the EPA's assumed speeds and the real-world speeds.

TABLE 1-8: FUEL SAVINGS AT HIGHER SPEEDS – SKIRTS ONLY

Speed Range	EPA % Time @ Speed x % Savings at Speed	Fleet 1 % Time @ Speed x % Savings at Speed	Fleet 2 % Time @ Speed x % Savings at Speed	Fleet 3 % Time @ Speed x % Savings at Speed
0-70 mph	1.99%	0.95%	1.43%	1.29%
55-70 mph	1.94%	0.78%	1.23%	1.17%
65-70 mph	1.79%	0.03%	0.21%	0.54%

GRAPH 1-9: FUEL SAVINGS AT HIGHER SPEEDS – SKIRTS ONLY

The percentages of time at each speed used in this analysis were averages within each fleet. But the data for the fleets was derived from thousands of tractor/trailers. If the speed profiles of the individual tractors within a fleet were used instead of a fleet average, one could see significant variation within a fleet. For example, Table 1-10 and its corresponding Graph 1-11 show the fuel savings from both the truck in Fleet 2 (which itself had the highest average speed) that had the highest average speed, and the truck in that fleet that had the lowest average speed. Even for the single truck with the highest recorded speeds in the fleet with the highest average speeds, there is a dramatic difference in fuel efficiency at all speed groupings, as compared with the efficiencies calculated from the EPA assumed speeds.

**TABLE 1-10: FLEET 2 – FUEL SAVINGS FOR TRUCKS WITH
FASTEST AND SLOWEST AVERAGE SPEEDS WITHIN THE FLEET – SKIRTS ONLY**

Speed Range	EPA Fuel Efficiency	Fleet 2 Truck # 65000	Fleet 2 Truck # 651007
0-70 mph	1.99%	1.58%	1.24%
55-70 mph	1.94%	1.45%	1.02%
65-70 mph	1.79%	0.49%	0.08%

GRAPH 1-11: FUEL SAVINGS AT SPEED – SKIRTS ONLY

The information provided on pages 29 (Graph 1-6) through here (Graph 1-11) focuses on projected fuel savings achieved by trailers equipped only with side skirts. A similar analysis can be performed for trailers equipped with both side skirts and

trailer tails. The only difference in the calculation is that the drag coefficient is reduced to 0.423 (from 0.459 for the base trailer with the skirt alone), the appropriate number with 0-degree yaw as determined by the computational fluid dynamic analysis performed by Exa Corporation. This calculation also demonstrates that for trailers equipped with both skirts and trailer tails, fuel savings – based upon real-world data for three trailer fleets – will be far less than projected using the EPA GEM model assumption that the trailer travels at 65 mph 86% of the time.

TABLE 1-12: TIME AND FUEL SAVINGS AT EACH SPEED – SKIRTS & TAILS

Cruising Speed [mph]	Cruising Speed [Meters/sec]	% Change in Power (Fuel savings)	EPA % Time @ Speed	EPA % Time @ Speed x % Savings at Speed	Fleet 1 % Time @ Speed	Fleet 1 % Time @ Speed x % Savings at Speed	Fleet 2 % Time @ Speed	Fleet2 % Time @ Speed x % Savings at Speed	Fleet 3 % Time @ Speed	Fleet 3 % Time @ Speed x % Savings at Speed
0	0.00	0	0.00%	0.00%	38.57%	0.00%	14.70%	0.00%	20.26%	0.00%

Total				5.48%		2.67%		4.00%		3.61%

As Table 1-12 demonstrates, the EPA GEM model calculated savings are over twice those for those based on the real-world speed data for Fleet 1, 37% higher than the savings for Fleet 2, and nearly 52% higher than the savings for Fleet 3.
